# Package 'h2o'

April 9, 2020

**Version** 3.30.0.1

Type Package

Title R Interface for the 'H2O' Scalable Machine Learning Platform

Date 2020-04-03

Description R interface for 'H2O', the scalable open source machine learning platform that offers parallelized implementations of many supervised and unsupervised machine learning algorithms such as Generalized Linear Models, Gradient Boosting Machines (including XGBoost), Random Forests, Deep Neural Networks (Deep Learning), Stacked Ensembles, Naive Bayes, Cox Proportional Hazards, K-Means, PCA, Word2Vec, as well as a fully automatic machine learning algorithm (AutoML).

**License** Apache License (== 2.0)

URL https://github.com/h2oai/h2o-3

BugReports https://0xdata.atlassian.net/projects/PUBDEV

NeedsCompilation no

**SystemRequirements** Java (>= 8)

**Depends** R (>= 2.13.0), methods, stats

Imports graphics, tools, utils, RCurl, isonlite

**Suggests** ggplot2, mlbench, Matrix, slam, bit64 (>= 0.9.7), data.table (>= 1.9.8), rgl (>= 0.100.19), plot3Drgl (>= 1.0.1), survival

Collate 'aggregator.R' 'astfun.R' 'automl.R' 'classes.R' 'config.R' 'connection.R' 'constants.R' 'datasets.R' 'logging.R' 'communication.R' 'kvstore.R' 'frame.R' 'targetencoder\_deprecated.R' 'targetencoder.R' 'import.R' 'isolationforest.R' 'parse.R' 'export.R' 'edicts.R' 'models.R' 'coxph.R' 'coxphutils.R' 'kmeans.R' 'gam.R' 'gbm.R' 'generic.R' 'glm.R' 'glrm.R' 'pca.R' 'svd.R' 'psvm.R' 'deeplearning.R' 'stackedensemble.R' 'xgboost.R' 'randomforest.R' 'naivebayes.R' 'word2vec.R' 'w2vutils.R' 'locate.R' 'grid.R' 'segment.R' 'predict.R' 'zzz.R'

## Description

This is a package for running H2O via its REST API from within R. To communicate with a H2O instance, the version of the R package must match the version of H2O. When connecting to a new H2O cluster, it is necessary to re-run the initializer.

### **Details**

Package: h2o
Type: Package
Version: 3.30.0.1
Branch: rel-zahradnik

.addParm 11

Date: Fri Apr 03 20:51:23 UTC 2020 License: Apache License (== 2.0)

Depends: R (>= 2.13.0), RCurl, isonlite, statmod, tools, methods, utils

This package allows the user to run basic H2O commands using R commands. In order to use it, you must first have H2O running. To run H2O on your local machine, call h2o.init without any arguments, and H2O will be automatically launched at localhost:54321, where the IP is "127.0.0.1" and the port is 54321. If H2O is running on a cluster, you must provide the IP and port of the remote machine as arguments to the h2o.init() call.

H2O supports a number of standard statistical models, such as GLM, K-means, and Random Forest. For example, to run GLM, call h2o.glm with the H2O parsed data and parameters (response variable, error distribution, etc...) as arguments. (The operation will be done on the server associated with the data object where H2O is running, not within the R environment).

Note that no actual data is stored in the R workspace; and no actual work is carried out by R. R only saves the named objects, which uniquely identify the data set, model, etc on the server. When the user makes a request, R queries the server via the REST API, which returns a JSON file with the relevant information that R then displays in the console.

If you are using an older version of H2O, use the following porting guide to update your scripts: Porting Scripts

.addParm

TODO: No objects in this file are being used. Either remove file or use objects.

#### Description

Append a <key, value> pair to a list.

```
.addParm(parms, k, v)
```

.h2o.doGET

## **Arguments**

parms a list to add the  $\langle k, v \rangle$  pair to

k a key, typically the name of some algorithm parameter

v a value, the value of the algorithm parameter

#### **Details**

Contained here are a set of helper methods that perform type checking on the value passed in.

.collapse

Helper Collapse Function

#### Description

Collapse a character vector into a ','-sep array of the form: [thing1,thing2,...]

#### Usage

```
.collapse(v)
```

### **Arguments**

v Character vector.

.h2o.doGET

Just like doRawGET but fills in the default h2oRestApiVersion if none is provided

### **Description**

Just like doRawGET but fills in the default h2oRestApiVersion if none is provided

## Usage

```
.h2o.doGET(h2oRestApiVersion, urlSuffix, parms, ...)
```

#### **Arguments**

h2oRestApiVersion

(Optional) A version number to prefix to the urlSuffix. If no version is provided,

a default version is chosen for you.

urlSuffix The partial URL suffix to add to the calculated base URL for the instance

parms (Optional) Parameters to include in the request

... (Optional) Additional parameters.

.h2o.doPOST

### Value

A list object as described above

.h2o.doPOST	Just like doRawPOST but fills in the default h2oRestApiVersion if none is provided
-------------	--

## **Description**

Just like doRawPOST but fills in the default h2oRestApiVersion if none is provided

#### Usage

```
.h2o.doPOST(h2oRestApiVersion, urlSuffix, parms, ...)
```

#### **Arguments**

h2oRestApiVersion

(Optional) A version number to prefix to the urlSuffix. If no version is provided,

a default version is chosen for you.

urlSuffix The partial URL suffix to add to the calculated base URL for the instance

parms (Optional) Parameters to include in the request

... (Optional) Additional parameters.

#### Value

A list object as described above

.h2o.doRawGET

Perform a low-level HTTP GET operation on an H2O instance

## Description

Does not do any I/O level error checking. Caller must do its own validations. Does not modify the response payload in any way. Log the request and response if h2o.startLogging() has been called.

```
.h2o.doRawGET(
  conn = h2o.getConnection(),
  h2oRestApiVersion,
  urlSuffix,
  parms,
  ...
)
```

.h2o.doRawPOST

#### **Arguments**

conn H2OConnection

h2oRestApiVersion

(Optional) A version number to prefix to the urlSuffix. If no version is provided,

the version prefix is skipped.

urlSuffix The partial URL suffix to add to the calculated base URL for the instance

parms (Optional) Parameters to include in the request

... (Optional) Additional parameters.

#### **Details**

The return value is a list as follows: \$url - Final calculated URL. \$postBody - The body of the POST request from client to server. \$curlError - TRUE if a socket-level error occurred. FALSE otherwise. \$curlErrorMessage - If curlError is TRUE a message about the error. \$httpStatusCode - The HTTP status code. Usually 200 if the request succeeded. \$httpStatusMessage - A string describing the httpStatusCode. \$payload - The raw response payload as a character vector.

#### Value

A list object as described above

.h2o.doRawPOST

Perform a low-level HTTP POST operation on an H2O instance

#### **Description**

Does not do any I/O level error checking. Caller must do its own validations. Does not modify the response payload in any way. Log the request and response if h2o.startLogging() has been called.

#### Usage

```
.h2o.doRawPOST(
  conn = h2o.getConnection(),
  h2oRestApiVersion,
  urlSuffix,
  parms,
  fileUploadInfo,
  ...
)
```

### Arguments

conn H2OConnection

h2oRestApiVersion

(Optional) A version number to prefix to the urlSuffix. If no version is provided, the version prefix is skipped.

.h2o.doSafeGET

urlSuffix The partial URL suffix to add to the calculated base URL for the instance

parms (Optional) Parameters to include in the request

fileUploadInfo (Optional) Information to POST (NOTE: changes Content-type from XXXwww-url-encoded to multi-part). Use fileUpload(normalizePath("/path/to/file")).

... (Optional) Additional parameters.

#### **Details**

The return value is a list as follows: \$url - Final calculated URL. \$postBody - The body of the POST request from client to server. \$curlError - TRUE if a socket-level error occurred. FALSE otherwise. \$curlErrorMessage - If curlError is TRUE a message about the error. \$httpStatusCode - The HTTP status code. Usually 200 if the request succeeded. \$httpStatusMessage - A string describing the httpStatusCode. \$payload - The raw response payload as a character vector.

#### Value

A list object as described above

CHISTEI.	.h2o.doSafeGET	Perform a safe (i.e. cluster.	error-checked) HTTP GET request to an H2O
----------	----------------	-------------------------------	---

## Description

This function validates that no CURL error occurred and that the HTTP response code is successful. If a failure occurred, then stop() is called with an error message. Since all necessary error checking is done inside this call, the valid payload is directly returned if the function successfully finishes without calling stop().

#### Usage

```
.h2o.doSafeGET(h2oRestApiVersion, urlSuffix, parms, ...)
```

## Arguments

h2oRestApiVersion

(Optional) A version number to prefix to the urlSuffix. If no version is provided,

a default version is chosen for you.

urlSuffix The partial URL suffix to add to the calculated base URL for the instance

parms (Optional) Parameters to include in the request

... (Optional) Additional parameters.

#### Value

The raw response payload as a character vector

.h2o.is\_progress

.h2o.doSafePOST	Perform a safe (i.e. cluster.	error-checked) HTTP POST request to an H2O

## Description

This function validates that no CURL error occurred and that the HTTP response code is successful. If a failure occurred, then stop() is called with an error message. Since all necessary error checking is done inside this call, the valid payload is directly returned if the function successfully finishes without calling stop().

#### Usage

```
.h2o.doSafePOST(h2oRestApiVersion, urlSuffix, parms, fileUploadInfo, ...)
```

#### **Arguments**

h2oRestApiVersion

(Optional) A version number to prefix to the urlSuffix. If no version is provided,

a default version is chosen for you.

urlSuffix The partial URL suffix to add to the calculated base URL for the instance

parms (Optional) Parameters to include in the request

fileUploadInfo (Optional) Information to POST (NOTE: changes Content-type from XXX-

www-url-encoded to multi-part). Use fileUpload(normalizePath("/path/to/file")).

... (Optional) Additional parameters.

#### Value

The raw response payload as a character vector

### **Description**

Check if Progress Bar is Enabled

```
.h2o.is_progress()
```

.h2o.locate 17

Locate a file given the pattern <bucket>/<path/to/file> e.g. .h2o.locate h2o:::.h2o.locate("smalldata/iris/iris22.csv") returns the absolute path to iris22.csv

## Description

Locate a file given the pattern <br/>
<br/>
| Locate a file given the pattern <br/>
| Locate e.g. h20:::.h20.locate("smalldata/iris/iris22.csv") returns the absolute path to iris22.csv

## Usage

```
.h2o.locate(pathStub, root.parent = NULL)
```

## Arguments

pathStub relative path

root.parent search root directory

.h2o.primitives Map of operations known to H2O

## **Description**

Map of operations known to H2O

### Usage

.h2o.primitives

#### **Format**

An object of class character of length 39.

.h2o.\_\_ALL\_CAPABILITIES

Capabilities endpoints

## Description

Capabilities endpoints

## Usage

.h2o.\_\_ALL\_CAPABILITIES

### **Format**

An object of class character of length 1.

 $. \verb|h2o.__checkConnectionHealth|\\$ 

Check H2O Server Health

## Description

Warn if there are sick nodes.

## Usage

.h2o.\_\_checkConnectionHealth()

.h2o.\_\_CREATE\_FRAME

H2OFrame Manipulation

## Description

**H2OFrame Manipulation** 

## Usage

.h2o.\_\_CREATE\_FRAME

#### **Format**

An object of class character of length 1.

.h2o.\_\_DECRYPTION\_SETUP

Decryption Endpoints

## Description

**Decryption Endpoints** 

## Usage

.h2o.\_\_DECRYPTION\_SETUP

### **Format**

An object of class character of length 1.

.h2o.\_\_DKV

Removal Endpoints

## Description

Removal Endpoints

## Usage

.h2o.\_\_DKV

#### **Format**

An object of class character of length 1.

.h2o.\_\_EXPORT\_FILES

Export Files Endpoint Generator

## Description

Export Files Endpoint Generator

## Usage

.h2o.\_\_EXPORT\_FILES(frame)

## Arguments

frame

H2OFrame

.h2o.\_\_JOBS

.h2o.\_\_FRAMES

Inspect/Summary Endpoints

## Description

Inspect/Summary Endpoints

## Usage

```
.h2o.__FRAMES
```

### **Format**

An object of class character of length 1.

.h2o.\_\_IMPORT

Import/Export Endpoints

## Description

Import/Export Endpoints

### Usage

```
.h2o.__IMPORT
```

## **Format**

An object of class character of length 1.

.h2o.\_\_JOBS

Administrative Endpoints

## Description

Administrative Endpoints

### Usage

.h2o.\_\_JOBS

#### **Format**

An object of class character of length 1.

.h2o.\_\_LOGANDECHO

Log and Echo Endpoint

## Description

Log and Echo Endpoint

### Usage

.h2o.\_\_LOGANDECHO

### **Format**

An object of class character of length 1.

.h2o.\_\_MODELS

Model Endpoint

## Description

Model Endpoint

### Usage

.h2o.\_\_MODELS

#### **Format**

An object of class character of length 1.

## Description

Model Builder Endpoint Generator

### Usage

.h2o.\_\_MODEL\_BUILDERS(algo)

### **Arguments**

algo

Cannonical identifier of H2O algorithm.

.h2o.\_\_RAPIDS

### **Description**

Model Metrics Endpoint

### Usage

```
.h2o.__MODEL_METRICS(model, data)
```

### **Arguments**

model H2OModel. data H2OFrame.

## Description

Parse Endpoints

## Usage

.h2o.\_\_PARSE\_SETUP

#### **Format**

An object of class character of length 1.

.h2o.\_\_RAPIDS Rapids Endpoint

## Description

Rapids Endpoint

### Usage

.h2o.\_\_RAPIDS

## **Format**

An object of class character of length 1.

.h2o.\_\_REST\_API\_VERSION

H2O Package Constants

## Description

The API endpoints for interacting with H2O via REST are named here.

## Usage

```
.h2o.__REST_API_VERSION
```

#### **Format**

An object of class integer of length 1.

#### **Details**

Additionally, environment variables for the H2O package are named here. Endpoint Version

```
.h2o.__SEGMENT_MODELS_BUILDERS
```

Segment Models Builder Endpoint Generator

## Description

Segment Models Builder Endpoint Generator

## Usage

```
.h2o.__SEGMENT_MODELS_BUILDERS(algo)
```

## Arguments

algo Cannonical identifier of H2O algorithm.

.h2o.\_\_W2V\_SYNONYMS

Word2Vec Endpoints

### **Description**

Word2Vec Endpoints

## Usage

```
.h2o.__W2V_SYNONYMS
```

#### **Format**

An object of class character of length 1.

.pkg.env

The H2O Package Environment

## Description

The H2O Package Environment

### Usage

.pkg.env

### **Format**

An object of class environment of length 4.

```
.skip_if_not_developer
```

H2O <-> R Communication and Utility Methods

## Description

Collected here are the various methods used by the h2o-R package to communicate with the H2O backend. There are methods for checking cluster health, polling, and inspecting objects in the H2O store.

```
.skip_if_not_developer()
```

.verify\_dataxy 25

.verify\_dataxy

Used to verify data, x, y and turn into the appropriate things

## Description

Used to verify data, x, y and turn into the appropriate things

## Usage

```
.verify_dataxy(data, x, y, autoencoder = FALSE)
```

### **Arguments**

data	H2OFrame
X	features
у	response
autoencoder	autoencoder flag

aaa

Starting H2O For examples

## Description

Starting H2O For examples

## **Examples**

```
## Not run:
if (Sys.info()['sysname'] == "Darwin" && Sys.info()['release'] == '13.4.0') {
   quit(save="no")
} else {
   h2o.init(nthreads = 2)
}
## End(Not run)
```

26 apply

apply
-------

Apply on H2O Datasets

### **Description**

Method for apply on H2OFrame objects.

### Usage

```
apply(X, MARGIN, FUN, ...)
```

## **Arguments**

X an H2OFrame object on which apply will operate.

MARGIN the vector on which the function will be applied over, either 1 for rows or 2 for

columns.

FUN the function to be applied.
... optional arguments to FUN.

## Value

Produces a new H2OFrame of the output of the applied function. The output is stored in H2O so that it can be used in subsequent H2O processes.

#### See Also

```
apply for the base generic
```

### **Examples**

```
## Not run:
library(h2o)
h2o.init()
iris_hf <- as.h2o(iris)
summary(apply(iris_hf, 2, sum))
## End(Not run)</pre>
```

as,character.H2OFrame 27

```
as.character.H2OFrame Convert an H2OFrame to a String
```

## Description

Convert an H2OFrame to a String

## Usage

```
## S3 method for class 'H2OFrame'
as.character(x, ...)
```

#### **Arguments**

x An H2OFrame object

... Further arguments to be passed from or to other methods.

#### **Examples**

```
as.data.frame.H2OFrame
```

Converts parsed H2O data into an R data frame

## Description

Downloads the H2O data and then scans it in to an R data frame.

```
## S3 method for class 'H2OFrame'
as.data.frame(x, ...)
```

## Arguments

- x An H2OFrame object.
- . . . Further arguments to be passed down from other methods.

#### **Details**

Method as.data.frame.H20Frame will use fread if data.table package is installed in required version.

#### See Also

```
use.package
```

### **Examples**

```
## Not run:
library(h2o)
h2o.init()
prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.uploadFile(path = prostate_path)
as.data.frame(prostate)
## End(Not run)</pre>
```

```
as.data.frame.H2OSegmentModels
```

Converts a collection of Segment Models to a data.frame

## Description

Converts a collection of Segment Models to a data.frame

### Usage

```
## S3 method for class 'H2OSegmentModels' as.data.frame(x, ...)
```

#### Arguments

- x Object of class H2OSegmentModels.
- ... Further arguments to be passed down from other methods.

#### Value

Returns data.frame with result of segment model training.

as.factor 29

### **Examples**

as.factor

Convert H2O Data to Factors

## Description

Convert a column into a factor column.

## Usage

```
as.factor(x)
```

### **Arguments**

Х

a column from an H2OFrame data set.

#### See Also

```
as.factor.
```

## **Examples**

```
## Not run:
library(h2o)
h2o.init()
prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.uploadFile(path = prostate_path)
prostate[, 2] <- as.factor(prostate[, 2])
summary(prostate)
## End(Not run)</pre>
```

30 as.h2o

as.h2o

Create H2OFrame

#### **Description**

Import R object to the H2O cluster.

## Usage

```
as.h2o(x, destination_frame = "", ...)
## Default S3 method:
as.h2o(x, destination_frame = "", ...)
## S3 method for class 'H2OFrame'
as.h2o(x, destination_frame = "", ...)
## S3 method for class 'data.frame'
as.h2o(x, destination_frame = "", ...)
## S3 method for class 'Matrix'
as.h2o(x, destination_frame = "", ...)
```

#### **Arguments**

#### **Details**

Method as.h2o.data.frame will use fwrite if data.table package is installed in required version.

To speedup execution time for large sparse matrices, use h2o datatable. Make sure you have installed and imported data.table and slam packages. Turn on h2o datatable by options("h2o.use.data.table"=TRUE)

## End(Not run)
```

as.matrix.H2OFrame

Convert an H2OFrame to a matrix

### **Description**

Convert an H2OFrame to a matrix

## Usage

```
## S3 method for class 'H2OFrame'
as.matrix(x, ...)
```

#### **Arguments**

x An H2OFrame object

. . . Further arguments to be passed down from other methods.

### **Examples**

```
## Not run:
library(h2o)
h2o.init()
iris_hf <- as.h2o(iris)
describe <- h2o.describe(iris_hf)</pre>
```

32 as.vector.H2OFrame

```
mins = as.matrix(apply(iris_hf, 2, min))
print(mins)
## End(Not run)
```

as.numeric

Convert H2O Data to Numeric

## Description

Converts an H2O column into a numeric value column.

### Usage

```
as.numeric(x)
```

### **Arguments**

Х

a column from an H2OFrame data set.

### **Examples**

```
## Not run:
library(h2o)
h2o.init()
prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.uploadFile(path = prostate_path)
prostate[, 2] <- as.factor (prostate[, 2])
prostate[, 2] <- as.numeric(prostate[, 2])
## End(Not run)</pre>
```

 $\verb"as.vector.H2OF" rame"$ 

Convert an H2OFrame to a vector

### **Description**

Convert an H2OFrame to a vector

### Usage

```
## S3 method for class 'H2OFrame'
as.vector(x,mode)
```

## Arguments

x An H2OFrame objectmode Mode to coerce vector to

australia 33

#### **Examples**

```
## Not run:
library(h2o)
h2o.init()
iris_hf <- as.h2o(iris)
cor_R <- cor(as.matrix(iris[, 1]))
cor_h2o <- cor(iris_hf[, 1])
iris_R_cor <- cor(iris[, 1:4])
iris_H2O_cor <- as.data.frame(cor(iris_hf[, 1:4]))
h2o_vec <- as.vector(unlist(iris_H2O_cor))
r_vec <- as.vector(unlist(iris_R_cor))
## End(Not run)</pre>
```

australia

Australia Coastal Data

### **Description**

Temperature, soil moisture, runoff, and other environmental measurements from the Australia coast. The data is available from <a href="http://cs.colby.edu/courses/S11/cs251/labs/lab07/AustraliaSubset.csv">http://cs.colby.edu/courses/S11/cs251/labs/lab07/AustraliaSubset.csv</a>.

#### **Format**

A data frame with 251 rows and 8 columns

colnames

Returns the column names of an H2OFrame

### **Description**

Returns the column names of an H2OFrame

### Usage

```
colnames(x, do.NULL = TRUE, prefix = "col")
```

#### **Arguments**

x An H2OFrame object.

do. NULL logical. If FALSE and names are NULL, names are created.

prefix for created names.

34 dim.H2OFrame

### **Examples**

```
## Not run:
library(h2o)
h2o.init()

iris_hf <- as.h2o(iris)
colnames(iris_hf) # Returns "Sepal.Length" "Sepal.Width" "Petal.Length" "Petal.Width" "Species"
## End(Not run)</pre>
```

dim.H2OFrame

Returns the Dimensions of an H2OFrame

## Description

Returns the number of rows and columns for an H2OFrame object.

### Usage

```
## S3 method for class 'H2OFrame'
dim(x)
```

### **Arguments**

Х

An H2OFrame object.

## See Also

dim for the base R method.

## **Examples**

```
## Not run:
library(h2o)
h2o.init()

iris_hf <- as.h2o(iris)
dim(iris_hf)
## End(Not run)</pre>
```

dimnames.H2OFrame 35

dimnames.H2OFrame

Column names of an H2OFrame

#### **Description**

Set column names of an H2O Frame

#### Usage

```
## S3 method for class 'H2OFrame'
dimnames(x)
```

### Arguments

Х

An H2OFrame

## **Examples**

```
## Not run:
library(h2o)
h2o.init()

n <- 2000
# Generate variables V1, ... V10
X <- matrix(rnorm(10 * n), n, 10)
# y = +1 if sum_i x_{ij}^2 > chisq median on 10 df
y <- rep(-1, n)
y[apply(X*X, 1, sum) > qchisq(.5, 10)] <- 1
# Assign names to the columns of X:
dimnames(X)[[2]] <- c("V1", "V2", "V4", "V5", "V6", "V7", "V8", "V9", "V10")
## End(Not run)</pre>
```

feature\_frequencies.H2OModel

Retrieve the number of occurrences of each feature for given observations Available for GBM, Random Forest and Isolation Forest models.

## Description

Retrieve the number of occurrences of each feature for given observations Available for GBM, Random Forest and Isolation Forest models.

```
feature_frequencies.H2OModel(object, newdata, ...)
h2o.feature_frequencies(object, newdata, ...)
```

36 get\_seed.H2OModel

#### **Arguments**

object a fitted H2OModel object for which prediction is desired

newdata An H2OFrame object in which to look for variables with which to predict.

... additional arguments to pass on.

#### Value

Returns an H2OFrame contain per-feature frequencies on the predict path for each input row.

#### See Also

h2o.gbm and h2o.randomForest for model generation in h2o.

## Description

CHeck to see if the column names/indices entered is valid for the dataframe given. This is an internal function

#### Usage

```
generate_col_ind(data, by)
```

## **Arguments**

data	The H2OFrame whose column names or indices are entered as a list

by The column names/indices in a list.

user does not set the seed parameter before training, the seed is autogenerated. It returns seed as the string if the value is bigger than the integer. For example, an autogenerated seed is always long so that the

seed in R is a string.

#### **Description**

Get the seed from H2OModel which was used during training. If a user does not set the seed parameter before training, the seed is autogenerated. It returns seed as the string if the value is bigger than the integer. For example, an autogenerated seed is always long so that the seed in R is a string.

h2o.abs 37

## Usage

```
get_seed.H2OModel(object)
h2o.get_seed(object)
```

## **Arguments**

object

a fitted H2OModel object.

#### Value

Returns seed to be used during training a model. Could be numeric or string.

## **Examples**

```
## Not run:
library(h2o)
h2o.init()
prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.uploadFile(path = prostate_path)
prostate$CAPSULE <- as.factor(prostate$CAPSULE)
prostate_gbm <- h2o.gbm(3:9, "CAPSULE", prostate)
seed <- h2o.get_seed(prostate_gbm)
## End(Not run)</pre>
```

h2o.abs

Compute the absolute value of x

## Description

Compute the absolute value of x

# Usage

```
h2o.abs(x)
```

#### **Arguments**

Х

An H2OFrame object.

#### See Also

abs for the base R implementation.

38 h2o.acos

#### **Examples**

h2o.acos

Compute the arc cosine of x

## **Description**

Compute the arc cosine of x

### Usage

```
h2o.acos(x)
```

## **Arguments**

Х

An H2OFrame object.

## See Also

acos for the base R implementation.

```
## Not run:
h2o.init()
prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.uploadFile(path = prostate_path)
h2o.acos(prostate[,2])
## End(Not run)</pre>
```

h2o.aggregated\_frame

39

h2o.aggregated\_frame Retrieve an aggregated frame from an Aggregator model

## **Description**

Retrieve an aggregated frame from the Aggregator model and use it to create a new frame.

## Usage

```
h2o.aggregated_frame(model)
```

## Arguments

model

an H2OClusteringModel corresponding from a h2o.aggregator call.

### **Examples**

h2o.aggregator

Build an Aggregated Frame

## **Description**

Builds an Aggregated Frame of an H2OFrame.

40 h2o.aggregator

#### Usage

```
h2o.aggregator(
    training_frame,
    x,
    model_id = NULL,
    ignore_const_cols = TRUE,
    target_num_exemplars = 5000,
    rel_tol_num_exemplars = 0.5,
    transform = c("NONE", "STANDARDIZE", "NORMALIZE", "DEMEAN", "DESCALE"),
    categorical_encoding = c("AUTO", "Enum", "OneHotInternal", "OneHotExplicit", "Binary",
        "Eigen", "LabelEncoder", "SortByResponse", "EnumLimited"),
    save_mapping_frame = FALSE,
    num_iteration_without_new_exemplar = 500,
    export_checkpoints_dir = NULL
)
```

#### **Arguments**

training\_frame Id of the training data frame.

x A vector containing the character names of the predictors in the model.

model\_id Destination id for this model; auto-generated if not specified.

ignore\_const\_cols

Logical. Ignore constant columns. Defaults to TRUE.

target\_num\_exemplars

Targeted number of exemplars Defaults to 5000.

rel\_tol\_num\_exemplars

Relative tolerance for number of exemplars (e.g, 0.5 is +/- 50 percents) Defaults

10 0.

Transformation of training data Must be one of: "NONE", "STANDARDIZE", "NORMALIZE", "DEMEAN", "DESCALE". Defaults to NORMALIZE.

categorical\_encoding

transform

Encoding scheme for categorical features Must be one of: "AUTO", "Enum", "OneHotInternal", "OneHotExplicit", "Binary", "Eigen", "LabelEncoder", "Sort-ByResponse", "EnumLimited". Defaults to AUTO.

save\_mapping\_frame

Logical. Whether to export the mapping of the aggregated frame Defaults to FALSE.

num\_iteration\_without\_new\_exemplar

The number of iterations to run before aggregator exits if the number of exemplars collected didn't change Defaults to 500.

export\_checkpoints\_dir

Automatically export generated models to this directory.

## **Examples**

## Not run:

h2o.aic 41

h2o.aic

Retrieve the Akaike information criterion (AIC) value

### **Description**

Retrieves the AIC value. If "train", "valid", and "xval" parameters are FALSE (default), then the training AIC value is returned. If more than one parameter is set to TRUE, then a named vector of AICs are returned, where the names are "train", "valid" or "xval".

## Usage

```
h2o.aic(object, train = FALSE, valid = FALSE, xval = FALSE)
```

#### **Arguments**

object An H2OModel or H2OModelMetrics.
train Retrieve the training AIC
valid Retrieve the validation AIC
xval Retrieve the cross-validation AIC

```
## Not run:
library(h2o)
h2o.init()
prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.uploadFile(path = prostate_path)
p.sid <- h2o.runif(prostate)
prostate_train <- prostate[p.sid > .2,]
prostate_glm <- h2o.glm(x=3:7, y=2, training_frame=prostate_train)
aic_basic <- h2o.aic(prostate_glm)
print(aic_basic)
## End(Not run)</pre>
```

h2o.anomaly

h2o.all

Given a set of logical vectors, are all of the values true?

## **Description**

Given a set of logical vectors, are all of the values true?

### Usage

```
h2o.all(x)
```

#### **Arguments**

Х

An H2OFrame object.

#### See Also

all for the base R implementation.

h2o.anomaly

Anomaly Detection via H2O Deep Learning Model

## **Description**

Detect anomalies in an H2O dataset using an H2O deep learning model with auto-encoding.

## Usage

```
h2o.anomaly(object, data, per_feature = FALSE)
```

#### **Arguments**

object An H2OAutoEncoderModel object that represents the model to be used for

anomaly detection.

data An H2OFrame object.

per\_feature Whether to return the per-feature squared reconstruction error

## Value

Returns an H2OFrame object containing the reconstruction MSE or the per-feature squared error.

### See Also

h2o.deeplearning for making an H2OAutoEncoderModel.

h2o.any 43

#### **Examples**

h2o.any

Given a set of logical vectors, is at least one of the values true?

## **Description**

Given a set of logical vectors, is at least one of the values true?

### Usage

h2o.any(x)

#### **Arguments**

Х

An H2OFrame object.

## See Also

all for the base R implementation.

```
## Not run:
library(h2o)
h2o.init()

f <- "http://h2o-public-test-data.s3.amazonaws.com/smalldata/iris/iris_train.csv"
iris <- h2o.importFile(f)
h2o.any(iris[,1] < 1000)

## End(Not run)</pre>
```

h2o.arrange

h2o.anyFactor

Check H2OFrame columns for factors

## **Description**

Determines if any column of an H2OFrame object contains categorical data.

#### Usage

```
h2o.anyFactor(x)
```

#### **Arguments**

Х

An H20Frame object.

#### Value

Returns a logical value indicating whether any of the columns in x are factors.

## **Examples**

```
## Not run:
library(h2o)
h2o.init()
iris_hf <- as.h2o(iris)
h2o.anyFactor(iris_hf)
## End(Not run)</pre>
```

h2o.arrange

Sorts an H2O frame by columns

# Description

Sorts H2OFrame by the columns specified. H2OFrame can contain String columns but should not sort on any String columns. Otherwise, an error will be thrown. To sort column c1 in descending order, do desc(c1). Returns a new H2OFrame, like dplyr::arrange.

## Usage

```
h2o.arrange(x, ...)
```

## Arguments

x The H2OFrame input to be sorted.

... The column names to sort by.

h2o.ascharacter 45

## **Examples**

```
## Not run:
library(h2o)
h2o.init()

f <- "http://h2o-public-test-data.s3.amazonaws.com/smalldata/iris/iris_train.csv"
iris <- h2o.importFile(f)
h2o.arrange(iris, "species","petal_len","petal_wid")
## End(Not run)</pre>
```

h2o.ascharacter

Convert H2O Data to Characters

## Description

Convert H2O Data to Characters

## Usage

```
h2o.ascharacter(x)
```

## **Arguments**

Х

An H2OFrame object.

```
## Not run:
library(h2o)
h2o.init()

f <- "http://h2o-public-test-data.s3.amazonaws.com/smalldata/iris/iris_train.csv"
iris <- h2o.importFile(f)
h2o.ascharacter(iris["species"])
## End(Not run)</pre>
```

46 h2o.asnumeric

h2o.asfactor

Convert H2O Data to Factors

## Description

Convert H2O Data to Factors

## Usage

```
h2o.asfactor(x)
```

## **Arguments**

Χ

An H2OFrame object.

## See Also

as.numeric for the base R implementation.

# **Examples**

```
## Not run:
library(h2o)
h2o.init()

f <- "https://s3.amazonaws.com/h2o-public-test-data/smalldata/junit/cars_20mpg.csv"
cars <- h2o.importFile(f)
h2o.asfactor(cars["cylinders"])
## End(Not run)</pre>
```

h2o.asnumeric

Convert H2O Data to Numerics

## **Description**

Convert H2O Data to Numerics

# Usage

```
h2o.asnumeric(x)
```

## **Arguments**

Х

An H2OFrame object.

h2o.assign 47

#### See Also

as. factor for the base R implementation.

## **Examples**

```
## Not run:
library(h2o)
h2o.init()

f <- "https://s3.amazonaws.com/h2o-public-test-data/smalldata/junit/cars_20mpg.csv"
cars <- h2o.importFile(f)
h2o.asnumeric(cars)
## End(Not run)</pre>
```

h2o.assign

Rename an H2O object.

## **Description**

Makes a copy of the data frame and gives it the desired key.

#### Usage

```
h2o.assign(data, key)
```

## Arguments

data An H2OFrame object

key The key to be associated with the H2O parsed data object

```
## Not run:
library(h2o)
h2o.init()

f <- "https://s3.amazonaws.com/h2o-public-test-data/smalldata/junit/cars_20mpg.csv"
cars <- h2o.importFile(f)
dim(cars)
split <- h2o.splitFrame(data = cars, ratios = .8)
train <- h2o.assign(split[[1]], key = "train")
test <- h2o.assign(split[[2]], key = "test")
dim(train)
dim(test)

## End(Not run)</pre>
```

48 h2o.auc

h2o.as_date	Convert between character representations and objects of Date class

## Description

Functions to convert between character representations and objects of class "Date" representing calendar dates.

## Usage

```
h2o.as_date(x, format, ...)
```

## **Arguments**

X	H2OFrame column of strings or factors to be converted
format	A character string indicating date pattern
	Further arguments to be passed from or to other methods.

h2o.auc	Retrieve the AUC	

## **Description**

Retrieves the AUC value from an H2OBinomialMetrics. If "train", "valid", and "xval" parameters are FALSE (default), then the training AUC value is returned. If more than one parameter is set to TRUE, then a named vector of AUCs are returned, where the names are "train", "valid" or "xval".

#### Usage

```
h2o.auc(object, train = FALSE, valid = FALSE, xval = FALSE)
```

## Arguments

object	An H2OBinomialMetrics object.
train	Retrieve the training AUC
valid	Retrieve the validation AUC
xval	Retrieve the cross-validation AUC

### See Also

h2o.giniCoef for the Gini coefficient, h2o.mse for MSE, and h2o.metric for the various threshold metrics. See h2o.performance for creating H2OModelMetrics objects.

h2o.aucpr 49

#### **Examples**

```
## Not run:
library(h2o)
h2o.init()

prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.uploadFile(prostate_path)

prostate[,2] <- as.factor(prostate[,2])
model <- h2o.gbm(x = 3:9, y = 2, training_frame = prostate, distribution = "bernoulli")
perf <- h2o.performance(model, prostate)
h2o.auc(perf)

## End(Not run)</pre>
```

h2o.aucpr

Retrieve the AUCPR (Area Under Precision Recall Curve)

### Description

Retrieves the AUCPR value from an H2OBinomialMetrics. If "train", "valid", and "xval" parameters are FALSE (default), then the training AUCPR value is returned. If more than one parameter is set to TRUE, then a named vector of AUCPRs are returned, where the names are "train", "valid" or "xval".

### Usage

```
h2o.aucpr(object, train = FALSE, valid = FALSE, xval = FALSE)
h2o.pr_auc(object, train = FALSE, valid = FALSE, xval = FALSE)
```

### **Arguments**

object	An H2OBinomialMetrics object.
train	Retrieve the training aucpr
valid	Retrieve the validation aucpr
xval	Retrieve the cross-validation aucpr

#### See Also

h2o.giniCoef for the Gini coefficient, h2o.mse for MSE, and h2o.metric for the various threshold metrics. See h2o.performance for creating H2OModelMetrics objects.

50 h2o,automl

#### **Examples**

```
## Not run:
library(h2o)
h2o.init()

prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.uploadFile(prostate_path)

prostate[,2] <- as.factor(prostate[,2])
model <- h2o.gbm(x = 3:9, y = 2, training_frame = prostate, distribution = "bernoulli")
perf <- h2o.performance(model, prostate)
h2o.aucpr(perf)

## End(Not run)</pre>
```

h2o.automl

Automatic Machine Learning

#### **Description**

The Automatic Machine Learning (AutoML) function automates the supervised machine learning model training process. The current version of AutoML trains and cross-validates a Random Forest, an Extremely-Randomized Forest, a random grid of Gradient Boosting Machines (GBMs), a random grid of Deep Neural Nets, and then trains a Stacked Ensemble using all of the models.

#### Usage

```
h2o.automl(
  Х,
  training_frame,
  validation_frame = NULL,
  leaderboard_frame = NULL,
  blending_frame = NULL,
  nfolds = 5,
  fold_column = NULL,
  weights_column = NULL,
  balance_classes = FALSE,
  class_sampling_factors = NULL,
  max_after_balance_size = 5,
 max_runtime_secs = NULL,
 max_runtime_secs_per_model = NULL,
 max_models = NULL,
 stopping_metric = c("AUTO", "deviance", "logloss", "MSE", "RMSE", "MAE", "RMSLE",
  "AUC", "AUCPR", "lift_top_group", "misclassification", "mean_per_class_error"),
  stopping_tolerance = NULL,
  stopping_rounds = 3,
```

51 h2o.autom1

```
seed = NULL,
  project_name = NULL,
  exclude_algos = NULL,
  include_algos = NULL,
 modeling_plan = NULL,
  exploitation_ratio = 0,
 monotone_constraints = NULL,
  algo_parameters = NULL,
  keep_cross_validation_predictions = FALSE,
  keep_cross_validation_models = FALSE,
 keep_cross_validation_fold_assignment = FALSE,
 sort_metric = c("AUTO", "deviance", "logloss", "MSE", "RMSE", "MAE", "RMSLE", "AUC",
    "AUCPR", "mean_per_class_error"),
  export_checkpoints_dir = NULL,
  verbosity = "warn"
)
```

#### **Arguments**

У

A vector containing the names or indices of the predictor variables to use in Χ building the model. If x is missing, then all columns except y are used.

> The name or index of the response variable in the model. For classification, the y column must be a factor, otherwise regression will be performed. Indexes are 1-based in R.

training\_frame Training frame (H2OFrame or ID). validation\_frame

> Validation frame (H2OFrame or ID); Optional. This argument is ignored unless the user sets n = 0. If cross-validation is turned off, then a validation frame can be specified and used for early stopping of individual models and early stopping of the grid searches. By default and when nfolds > 1, crossvalidation metrics will be used for early stopping and thus validation\_frame will be ignored.

### leaderboard\_frame

Leaderboard frame (H2OFrame or ID); Optional. If provided, the Leaderboard will be scored using this data frame intead of using cross-validation metrics, which is the default.

blending\_frame Blending frame (H2OFrame or ID) used to train the the metalearning algorithm in Stacked Ensembles (instead of relying on cross-validated predicted values); Optional. When provided, it also is recommended to disable cross validation by setting 'nfolds=0' and to provide a leaderboard frame for scoring purposes.

> Number of folds for k-fold cross-validation. Defaults to 5. Use 0 to disable cross-validation; this will also disable Stacked Ensemble (thus decreasing the overall model performance).

Column with cross-validation fold index assignment per observation; used to override the default, randomized, 5-fold cross-validation scheme for individual models in the AutoML run.

nfolds

fold\_column

52 h2o.autom1

weights\_column Column with observation weights. Giving some observation a weight of zero is equivalent to excluding it from the dataset; giving an observation a relative weight of 2 is equivalent to repeating that row twice. Negative weights are not allowed.

balance\_classes

Logical. Balance training data class counts via over/under-sampling (for imbalanced data). Defaults to FALSE.

class\_sampling\_factors

Desired over/under-sampling ratios per class (in lexicographic order). If not specified, sampling factors will be automatically computed to obtain class balance during training. Requires balance classes.

max\_after\_balance\_size

Maximum relative size of the training data after balancing class counts (can be less than 1.0). Requires balance\_classes. Defaults to 5.0.

max\_runtime\_secs

This argument specifies the maximum time that the AutoML process will run for, prior to training the final Stacked Ensemble models. If neither 'max\_runtime\_secs' nor 'max\_models' are specified by the user, then 'max\_runtime\_secs' defaults to 3600 seconds (1 hour).

max\_runtime\_secs\_per\_model

Maximum runtime in seconds dedicated to each individual model training process. Use 0 to disable. Defaults to 0.

max\_models

Maximum number of models to build in the AutoML process (does not include Stacked Ensembles). Defaults to NULL (no strict limit).

stopping\_metric

Metric to use for early stopping ("AUTO" is logloss for classification, deviance for regression). Must be one of "AUTO", "deviance", "logloss", "MSE", "RMSE", "MAE", "RMSLE", "AUC", "AUCPR", "lift\_top\_group", "misclassification", "mean\_per\_class\_error". Defaults to "AUTO".

stopping\_tolerance

Relative tolerance for metric-based stopping criterion (stop if relative improvement is not at least this much). This value defaults to 0.001 if the dataset is at least 1 million rows; otherwise it defaults to a bigger value determined by the size of the dataset and the non-NA-rate. In that case, the value is computed as 1/sqrt(nrows \* non-NA-rate).

stopping\_rounds

Integer. Early stopping based on convergence of stopping\_metric. Stop if simple moving average of length k of the stopping\_metric does not improve for k (stopping\_rounds) scoring events. Defaults to 3 and must be an non-zero integer. Use 0 to disable early stopping.

seed

Integer. Set a seed for reproducibility. AutoML can only guarantee reproducibility if max\_models or early stopping is used because max\_runtime\_secs is resource limited, meaning that if the resources are not the same between runs, AutoML may be able to train more models on one run vs another.

project\_name

Character string to identify an AutoML project. Defaults to NULL, which means a project name will be auto-generated.

h2o.automl 53

exclude\_algos

Vector of character strings naming the algorithms to skip during the model-building phase. An example use is exclude\_algos = c("GLM", "DeepLearning", "DRF"), and the full list of options is: "DRF" (Random Forest and Extremely-Randomized Trees), "GLM", "XGBoost", "GBM", "DeepLearning" and "StackedEnsemble". Defaults to NULL, which means that all appropriate H2O algorithms will be used, if the search stopping criteria allow. Optional.

include\_algos

Vector of character strings naming the algorithms to restrict to during the model-building phase. This can't be used in combination with exclude\_algos param. Defaults to NULL, which means that all appropriate H2O algorithms will be used, if the search stopping criteria allow. Optional.

modeling\_plan

List. The list of modeling steps to be used by the AutoML engine (they may not all get executed, depending on other constraints). Optional (Expert usage only).

exploitation\_ratio

The budget ratio (between 0 and 1) dedicated to the exploitation (vs exploration) phase. By default, the exploitation phase is disabled (exploitation\_ratio=0) as this is still experimental; to activate it, it is recommended to try a ratio around 0.1. Note that the current exploitation phase only tries to fine-tune the best XGBoost and the best GBM found during exploration.

monotone\_constraints

List. A mapping representing monotonic constraints. Use +1 to enforce an increasing constraint and -1 to specify a decreasing constraint.

algo\_parameters

List. A list of param\_name=param\_value to be passed to internal models. Defaults to none (Expert usage only). By default, params are set only to algorithms accepting them, and ignored by others. Only following parameters are currently allowed: "monotone\_constraints".

keep\_cross\_validation\_predictions

Logical. Whether to keep the predictions of the cross-validation predictions. This needs to be set to TRUE if running the same AutoML object for repeated runs because CV predictions are required to build additional Stacked Ensemble models in AutoML. This option defaults to FALSE.

keep\_cross\_validation\_models

Logical. Whether to keep the cross-validated models. Keeping cross-validation models may consume significantly more memory in the H2O cluster. This option defaults to FALSE.

 $keep\_cross\_validation\_fold\_assignment$ 

Logical. Whether to keep fold assignments in the models. Deleting them will save memory in the H2O cluster. Defaults to FALSE.

sort\_metric

Metric to sort the leaderboard by. For binomial classification choose between "AUC", "AUCPR", "logloss", "mean\_per\_class\_error", "RMSE", "MSE". For regression choose between "mean\_residual\_deviance", "RMSE", "MSE", "MAE", and "RMSLE". For multinomial classification choose between "mean\_per\_class\_error", "logloss", "RMSE", "MSE". Default is "AUTO". If set to "AUTO", then "AUC" will be used for binomial classification, "mean\_per\_class\_error" for multinomial classification, and "mean\_residual\_deviance" for regression.

export\_checkpoints\_dir

(Optional) Path to a directory where every model will be stored in binary form.

54 h2o.betweenss

verbosity Verbosity of the backend messages printed during training; Optional. Must be one of NULL (live log disabled), "debug", "info", "warn". Defaults to "warn".

#### **Details**

AutoML finds the best model, given a training frame and response, and returns an H2OAutoML object, which contains a leaderboard of all the models that were trained in the process, ranked by a default model performance metric.

#### Value

An H2OAutoML object.

### **Examples**

```
## Not run:
library(h2o)
h2o.init()
votes_path <- system.file("extdata", "housevotes.csv", package = "h2o")
votes_hf <- h2o.uploadFile(path = votes_path, header = TRUE)
aml <- h2o.automl(y = "Class", training_frame = votes_hf, max_runtime_secs = 30)
## End(Not run)</pre>
```

h2o.betweenss

Get the between cluster sum of squares

## **Description**

Get the between cluster sum of squares. If "train", "valid", and "xval" parameters are FALSE (default), then the training betweenss value is returned. If more than one parameter is set to TRUE, then a named vector of betweenss' are returned, where the names are "train", "valid" or "xval".

## Usage

```
h2o.betweenss(object, train = FALSE, valid = FALSE, xval = FALSE)
```

# Arguments

object	An H2OClusteringModel object.
train	Retrieve the training between cluster sum of squares
valid	Retrieve the validation between cluster sum of squares
xval	Retrieve the cross-validation between cluster sum of squares

h2o.biases 55

#### **Examples**

```
## Not run:
library(h2o)
h2o.init()
fr <- h2o.importFile("http://h2o-public-test-data.s3.amazonaws.com/smalldata/iris/iris_train.csv")
predictors <- c("sepal_len", "sepal_wid", "petal_len", "petal_wid")
km <- h2o.kmeans(x = predictors, training_frame = fr, k = 3, nfolds = 3)
h2o.betweenss(km, train = TRUE)
## End(Not run)</pre>
```

h2o.biases

Return the respective bias vector

### Description

Return the respective bias vector

#### **Usage**

```
h2o.biases(object, vector_id = 1)
```

## Arguments

object An H2OModel or H2OModelMetrics

vector\_id An integer, ranging from 1 to number of layers + 1, that specifies the bias vector

to return.

56 h2o.bottomN

## Description

bottomN function will will grab the bottom N percent of values of a column and return it in a H2OFrame. Extract the top N percent of values of a column and return it in a H2OFrame.

### Usage

```
h2o.bottomN(x, column, nPercent)
```

### **Arguments**

x an H2OFrame

column is a column name or column index to grab the top N percent value from

nPercent is a bottom percentage value to grab

## Value

An H2OFrame with 2 columns. The first column is the original row indices, second column contains the bottomN values

```
## Not run:
library(h2o)
h2o.init()

f1 <- "https://s3.amazonaws.com/h2o-public-test-data/bigdata/laptop/jira/TopBottomNRep4.csv.zip"
f2 <- "https://s3.amazonaws.com/h2o-public-test-data/smalldata/jira/Bottom20Per.csv.zip"
dataFrame <- h2o.importFile(f1)
bottomAnswer <- h2o.importFile(f2)
nPercent <- c(1, 2, 3, 4)
frameNames <- names(dataFrame)
nP <- nPercent[sample(1:length(nPercent), 1, replace = FALSE)]
colIndex <- sample(1:length(frameNames), 1, replace = FALSE)
h2o.bottomN(dataFrame, frameNames[colIndex], nP)

## End(Not run)</pre>
```

h2o.cbind 57

h2o.cbind

Combine H2O Datasets by Columns

## Description

Takes a sequence of H2O data sets and combines them by column

### Usage

```
h2o.cbind(...)
```

## Arguments

A sequence of H2OFrame arguments. All datasets must exist on the same H2O instance (IP and port) and contain the same number of rows.

#### Value

An H2OFrame object containing the combined ... arguments column-wise.

#### See Also

cbind for the base R method.

## **Examples**

```
## Not run:
library(h2o)
h2o.init()
prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.uploadFile(path = prostate_path)
prostate_cbind <- h2o.cbind(prostate, prostate)
head(prostate_cbind)
## End(Not run)</pre>
```

h2o.ceiling

Take a single numeric argument and return a numeric vector with the smallest integers

### **Description**

ceiling takes a single numeric argument x and returns a numeric vector containing the smallest integers not less than the corresponding elements of x.

58 h2o.centers

#### Usage

```
h2o.ceiling(x)
```

## **Arguments**

Х

An H2OFrame object.

#### See Also

ceiling for the base R implementation.

# Examples

```
## Not run:
library(h2o)
h2o.init()

f <- "http://h2o-public-test-data.s3.amazonaws.com/smalldata/iris/iris_train.csv"
iris <- h2o.importFile(f)
h2o.ceiling(iris[,1])
## End(Not run)</pre>
```

h2o.centers

Retrieve the Model Centers

# Description

Retrieve the Model Centers

# Usage

```
h2o.centers(object)
```

## **Arguments**

object

An H2OClusteringModel object.

```
## Not run:
library(h2o)
h2o.init()
fr <- h2o.importFile("http://h2o-public-test-data.s3.amazonaws.com/smalldata/iris/iris_train.csv")
h2o.ceiling(fr[,1])
## End(Not run)</pre>
```

h2o.centersSTD 59

h2o.centersSTD	Retrieve the Model Centers STD	

## Description

Retrieve the Model Centers STD

## Usage

```
h2o.centersSTD(object)
```

## **Arguments**

object An H2OClusteringModel object.

## **Examples**

```
## Not run:
library(h2o)
h2o.init()
fr <- h2o.importFile("http://h2o-public-test-data.s3.amazonaws.com/smalldata/iris/iris_train.csv")
predictors <- c("sepal_len", "sepal_wid", "petal_len", "petal_wid")
km <- h2o.kmeans(x = predictors, training_frame = fr, k = 3, nfolds = 3)
h2o.centersSTD(km)
## End(Not run)</pre>
```

h2o.centroid\_stats

Retrieve centroid statistics

## Description

Retrieve the centroid statistics. If "train", "valid", and "xval" parameters are FALSE (default), then the training centroid stats value is returned. If more than one parameter is set to TRUE, then a named list of centroid stats data frames are returned, where the names are "train", "valid" or "xval".

## Usage

```
h2o.centroid_stats(object, train = FALSE, valid = FALSE, xval = FALSE)
```

# Arguments

object	An H2OClusteringModel object.
train	Retrieve the training centroid statistics
valid	Retrieve the validation centroid statistics
xval	Retrieve the cross-validation centroid statistics

h2o.clearLog

#### **Examples**

```
## Not run:
library(h2o)
h2o.init()
fr <- h2o.importFile("http://h2o-public-test-data.s3.amazonaws.com/smalldata/iris/iris_train.csv")
predictors <- c("sepal_len", "sepal_wid", "petal_len", "petal_wid")
km <- h2o.kmeans(x = predictors, training_frame = fr, k = 3, nfolds = 3)
h2o.centroid_stats(km, train = TRUE)
## End(Not run)</pre>
```

h2o.clearLog

Delete All H2O R Logs

## Description

Clear all H2O R command and error response logs from the local disk. Used primarily for debugging purposes.

### Usage

```
h2o.clearLog()
```

#### See Also

```
h2o.startLogging,h2o.stopLogging,h2o.openLog
```

```
## Not run:
library(h2o)
h2o.init()
h2o.startLogging()
australia_path = system.file("extdata", "australia.csv", package = "h2o")
australia = h2o.importFile(path = australia_path)
h2o.stopLogging()
h2o.clearLog()
## End(Not run)
```

h2o.clusterInfo

h2o.clusterInfo

Print H2O cluster info

## Description

Print H2O cluster info

## Usage

h2o.clusterInfo()

h2o.clusterIsUp

Determine if an H2O cluster is up or not

## Description

Determine if an H2O cluster is up or not

## Usage

```
h2o.clusterIsUp(conn = h2o.getConnection())
```

## **Arguments**

conn

H2OConnection object

## Value

TRUE if the cluster is up; FALSE otherwise

h2o.clusterStatus

Return the status of the cluster

# Description

Retrieve information on the status of the cluster running H2O.

## Usage

h2o.clusterStatus()

## See Also

H2OConnection, h2o.init

h2o.cluster\_sizes

#### **Examples**

```
## Not run:
h2o.init()
h2o.clusterStatus()
## End(Not run)
```

h2o.cluster\_sizes

Retrieve the cluster sizes

## **Description**

Retrieve the cluster sizes. If "train", "valid", and "xval" parameters are FALSE (default), then the training cluster sizes value is returned. If more than one parameter is set to TRUE, then a named list of cluster size vectors are returned, where the names are "train", "valid" or "xval".

### Usage

```
h2o.cluster_sizes(object, train = FALSE, valid = FALSE, xval = FALSE)
```

# Arguments

object An H2OClusteringModel object.

train Retrieve the training cluster sizes

valid Retrieve the validation cluster sizes

xval Retrieve the cross-validation cluster sizes

```
## Not run:
library(h2o)
h2o.init()
fr <- h2o.importFile("http://h2o-public-test-data.s3.amazonaws.com/smalldata/iris/iris_train.csv")
predictors <- c("sepal_len", "sepal_wid", "petal_len", "petal_wid")
km <- h2o.kmeans(x = predictors, training_frame = fr, k = 3, nfolds = 3)
h2o.cluster_sizes(km, train = TRUE)
## End(Not run)</pre>
```

h2o.coef 63

h2o.coef

Return the coefficients that can be applied to the non-standardized data.

### **Description**

Note: standardize = True by default. If set to False, then coef() returns the coefficients that are fit directly.

## Usage

```
h2o.coef(object)
```

## **Arguments**

object

an H2OModel object.

### **Examples**

```
## Not run:
library(h2o)
h2o.init()
f <- "https://s3.amazonaws.com/h2o-public-test-data/smalldata/junit/cars_20mpg.csv"
cars <- h2o.importFile(f)</pre>
predictors <- c("displacement", "power", "weight", "acceleration", "year")</pre>
response <- "cylinders"</pre>
cars.split <- h2o.splitFrame(data = cars,ratios = 0.8, seed = 1234)</pre>
train <- cars.split[[1]]</pre>
valid <- cars.split[[2]]</pre>
cars_glm <- h2o.glm(balance_classes = TRUE,</pre>
                      seed = 1234,
                      x = predictors,
                      y = response,
                      training_frame = train,
                      validation_frame = valid)
h2o.coef(cars_glm)
## End(Not run)
```

h2o.coef\_norm

Return coefficients fitted on the standardized data (requires standardize = True, which is on by default). These coefficients can be used to evaluate variable importance.

64 h2o.colnames

### **Description**

Return coefficients fitted on the standardized data (requires standardize = True, which is on by default). These coefficients can be used to evaluate variable importance.

#### Usage

```
h2o.coef_norm(object)
```

#### **Arguments**

object

an H2OModel object.

## **Examples**

```
## Not run:
library(h2o)
h2o.init()
f <- "https://s3.amazonaws.com/h2o-public-test-data/smalldata/junit/cars_20mpg.csv"</pre>
cars <- h2o.importFile(f)</pre>
predictors <- c("displacement", "power", "weight", "acceleration", "year")</pre>
response <- "cylinders"</pre>
cars.split <- h2o.splitFrame(data = cars,ratios = 0.8, seed = 1234)</pre>
train <- cars.split[[1]]</pre>
valid <- cars.split[[2]]</pre>
cars_glm <- h2o.glm(balance_classes = TRUE,</pre>
                      seed = 1234,
                      x = predictors,
                      y = response,
                      training_frame = train,
                      validation_frame = valid)
h2o.coef(cars_glm)
## End(Not run)
```

h2o.colnames

Return column names of an H2OFrame

## Description

Return column names of an H2OFrame

## Usage

```
h2o.colnames(x)
```

### **Arguments**

Х

An H2OFrame object.

h2o.columns\_by\_type

65

#### See Also

colnames for the base R implementation.

## **Examples**

h2o.columns\_by\_type

Obtain a list of columns that are specified by 'coltype'

#### **Description**

Obtain a list of columns that are specified by 'coltype'

# Usage

```
h2o.columns_by_type(object, coltype = "numeric", ...)
```

## **Arguments**

object H2OFrame object

coltype A character string indicating which column type to filter by. This must be one of the following: "numeric" - Numeric, but not categorical or time "categorical" - Integer, with a categorical/factor String mapping "string" - String column "time" - Long msec since the Unix Epoch - with a variety of display/parse options "uuid" - UUID "bad" - No none-NA rows (triple negative! all NAs or zero rows)

Ignored

# Value

. . .

A list of column indices that correspond to "type"

h2o.computeGram

#### **Examples**

```
## Not run:
h2o.init()
prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.uploadFile(path = prostate_path)
h2o.columns_by_type(prostate, coltype="numeric")
## End(Not run)</pre>
```

h2o.computeGram

Compute weighted gram matrix.

### **Description**

Compute weighted gram matrix.

## Usage

```
h2o.computeGram(
   X,
   weights = "",
   use_all_factor_levels = FALSE,
   standardize = TRUE,
   skip_missing = FALSE
)
```

## **Arguments**

X an H2OModel corresponding to H2O framel.

weights character corresponding to name of weight vector in frame.

use\_all\_factor\_levels

logical flag telling h2o whether or not to skip first level of categorical variables

during one-hot encoding.

standardize logical flag telling h2o whether or not to standardize data

skip\_missing logical flag telling h2o whether skip rows with missing data or impute them with

mean

h2o.confusionMatrix 67

h2o.confusionMatrix Access H2O Confusion Matrices

#### **Description**

Retrieve either a single or many confusion matrices from H2O objects.

### Usage

```
h2o.confusionMatrix(object, ...)
## S4 method for signature 'H2OModel'
h2o.confusionMatrix(object, newdata, valid = FALSE, ...)
## S4 method for signature 'H2OModelMetrics'
h2o.confusionMatrix(object, thresholds = NULL, metrics = NULL)
```

#### **Arguments**

object	Either an H2OModel object or an H2OModelMetrics object.
	Extra arguments for extracting train or valid confusion matrices.
newdata	An H2OFrame object that can be scored on. Requires a valid response column.
valid	Retrieve the validation metric.
thresholds	(Optional) A value or a list of valid values between 0.0 and 1.0. This value is only used in the case of H2OBinomialMetrics objects.
metrics	(Optional) A metric or a list of valid metrics ("min_per_class_accuracy", "absolute_mcc", "tnr", "fnr", "fpr", "precision", "accuracy", "f0point5", "f2", "f1"). This value is only used in the case of H2OBinomialMetrics objects.

### **Details**

The H2OModelMetrics version of this function will only take H2OBinomialMetrics or H2OMultinomialMetrics objects. If no threshold is specified, all possible thresholds are selected.

### Value

Calling this function on H2OModel objects returns a confusion matrix corresponding to the predict function. If used on an H2OBinomialMetrics object, returns a list of matrices corresponding to the number of thresholds specified.

#### See Also

predict for generating prediction frames, h2o.performance for creating H2OModelMetrics.

68 h2o.connect

#### **Examples**

```
## Not run:
library(h2o)
h2o.init()
prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.uploadFile(prostate_path)
prostate[,2] <- as.factor(prostate[,2])
model <- h2o.gbm(x = 3:9, y = 2, training_frame = prostate, distribution = "bernoulli")
h2o.confusionMatrix(model, prostate)
# Generating a ModelMetrics object
perf <- h2o.performance(model, prostate)
h2o.confusionMatrix(perf)
## End(Not run)</pre>
```

h2o.connect

Connect to a running H2O instance.

## **Description**

Connect to a running H2O instance.

#### Usage

```
h2o.connect(
   ip = "localhost",
   port = 54321,
   strict_version_check = TRUE,
   proxy = NA_character_,
   https = FALSE,
   cacert = NA_character_,
   insecure = FALSE,
   username = NA_character_,
   password = NA_character_,
   use_spnego = FALSE,
   cookies = NA_character_,
   context_path = NA_character_,
   config = NULL
)
```

## **Arguments**

ip Object of class character representing the IP address of the server where H2O

is running.

port Object of class numeric representing the port number of the H2O server.

strict\_version\_check

(Optional) Setting this to FALSE is unsupported and should only be done when advised by technical support.

h2o.cor 69

(Optional) A character string specifying the proxy path. proxy (Optional) Set this to TRUE to use https instead of http. https Path to a CA bundle file with root and intermediate certificates of trusted CAs. cacert insecure (Optional) Set this to TRUE to disable SSL certificate checking. username (Optional) Username to login with. (Optional) Password to login with. password use\_spnego (Optional) Set this to TRUE to enable SPNEGO authentication. cookies (Optional) Vector(or list) of cookies to add to request. context\_path (Optional) The last part of connection URL: http://<ip>:<port>/<context\_path> config (Optional) A list describing connection parameters. Using config makes h2o.connect ignore other parameters and collect named list members instead (see examples).

#### Value

an instance of H20Connection object representing a connection to the running H2O instance.

### **Examples**

```
## Not run:
library(h2o)
# Try to connect to a H2O instance running at http://localhost:54321/cluster_X
# If not found, start a local H2O instance from R with the default settings.
#h2o.connect(ip = "localhost", port = 54321, context_path = "cluster_X")
# Or
#config = list(ip = "localhost", port = 54321, context_path = "cluster_X")
#h2o.connect(config = config)

# Skip strict version check during connecting to the instance
#h2o.connect(config = c(strict_version_check = FALSE, config))

## End(Not run)
```

h2o.cor

Correlation of columns.

#### **Description**

Compute the correlation matrix of one or two H2OFrames.

# Usage

```
h2o.cor(x, y = NULL, na.rm = FALSE, use, method = "Pearson")
cor(x, ...)
```

70 h2o.cos

#### **Arguments**

x An H2OFrame object.

y NULL (default) or an H2OFrame. The default is equivalent to y = x.

na.rm logical. Should missing values be removed?

use An optional character string indicating how to handle missing values. This must

be one of the following: "everything" - outputs NaNs whenever one of its contributing observations is missing "all.obs" - presence of missing observations will throw an error "complete.obs" - discards missing values along with all ob-

servations in their rows so that only complete observations are used

method str Method of correlation computation. Allowed values are: "Pearson" - Pear-

son's correlation coefficient "Spearman" - Spearman's correlation coefficient

(Spearman's Rho) Defaults to "Pearson"

... Further arguments to be passed down from other methods.

### **Examples**

```
## Not run:
library(h2o)
h2o.init()

prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.uploadFile(path = prostate_path)
cor(prostate$AGE)

## End(Not run)</pre>
```

h2o.cos

Compute the cosine of x

## **Description**

Compute the cosine of x

## Usage

h2o.cos(x)

#### **Arguments**

Х

An H2OFrame object.

#### See Also

cos for the base R implementation.

h2o.cosh 71

## **Examples**

h2o.cosh

Compute the hyperbolic cosine of x

# Description

Compute the hyperbolic cosine of x

## Usage

```
h2o.cosh(x)
```

## **Arguments**

Χ

An H2OFrame object.

# See Also

cosh for the base R implementation.

72 h2o.coxph

h2o.coxph	Trains a Cox Proportional Hazards Model (CoxPH) on an H2O
	dataset

## Description

Trains a Cox Proportional Hazards Model (CoxPH) on an H2O dataset

## Usage

```
h2o.coxph(
  Х,
  event_column,
  training_frame,
 model_id = NULL,
  start_column = NULL,
  stop_column = NULL,
 weights_column = NULL,
  offset_column = NULL,
  stratify_by = NULL,
  ties = c("efron", "breslow"),
  init = 0,
  lre_min = 9,
 max_iterations = 20,
  interactions = NULL,
  interaction_pairs = NULL,
  interactions_only = NULL,
  use_all_factor_levels = FALSE,
  export_checkpoints_dir = NULL,
  single_node_mode = FALSE
)
```

## Arguments

Х	(Optional) A vector containing the names or indices of the predictor variables to use in building the model. If x is missing, then all columns except event_column, start_column and stop_column are used.
event_column	The name of binary data column in the training frame indicating the occurrence of an event.
training_frame	Id of the training data frame.
model_id	Destination id for this model; auto-generated if not specified.
start_column	Start Time Column.
stop_column	Stop Time Column.
weights_column	Column with observation weights. Giving some observation a weight of zero is equivalent to excluding it from the dataset; giving an observation a relative

h2o.coxph 73

weight of 2 is equivalent to repeating that row twice. Negative weights are not allowed. Note: Weights are per-row observation weights and do not increase the size of the data frame. This is typically the number of times a row is repeated, but non-integer values are supported as well. During training, rows with higher weights matter more, due to the larger loss function pre-factor.

offset\_column Offset column. This will be added to the combination of columns before apply-

ing the link function.

stratify\_by List of columns to use for stratification.

ties Method for Handling Ties. Must be one of: "efron", "breslow". Defaults to

efron.

init Coefficient starting value. Defaults to 0.

lre\_min Minimum log-relative error. Defaults to 9.

max\_iterations Maximum number of iterations. Defaults to 20.

interactions A list of predictor column indices to interact. All pairwise combinations will be

computed for the list.

interaction\_pairs

A list of pairwise (first order) column interactions.

interactions\_only

A list of columns that should only be used to create interactions but should not

itself participate in model training.

use\_all\_factor\_levels

Logical. (Internal. For development only!) Indicates whether to use all factor levels. Defaults to FALSE.

export\_checkpoints\_dir

Automatically export generated models to this directory.

single\_node\_mode

Logical. Run on a single node to reduce the effect of network overhead (for smaller datasets) Defaults to FALSE.

74 h2o.createFrame

```
stop_column = "stop")
## End(Not run)
```

h2o.createFrame

Data H2OFrame Creation in H2O

# **Description**

Creates a data frame in H2O with real-valued, categorical, integer, and binary columns specified by the user.

# Usage

```
h2o.createFrame(
  rows = 10000,
  cols = 10,
  randomize = TRUE,
  value = 0.
  real_range = 100,
  categorical_fraction = 0.2,
  factors = 100,
  integer_fraction = 0.2,
  integer_range = 100,
  binary_fraction = 0.1,
  binary_ones_fraction = 0.02,
  time_fraction = 0,
  string_fraction = 0,
  missing_fraction = 0.01,
  response_factors = 2,
  has_response = FALSE,
  seed,
  seed_for_column_types
)
```

# **Arguments**

rows	The number of rows of data to generate.
------	---

cols The number of columns of data to generate. Excludes the response column if

has\_response = TRUE.

randomize A logical value indicating whether data values should be randomly generated.

This must be TRUE if either categorical\_fraction or integer\_fraction is

non-zero

value If randomize = FALSE, then all real-valued entries will be set to this value.

real\_range The range of randomly generated real values.

h2o.createFrame 75

```
categorical_fraction
                  The fraction of total columns that are categorical.
factors
                  The number of (unique) factor levels in each categorical column.
integer_fraction
                  The fraction of total columns that are integer-valued.
integer_range
                  The range of randomly generated integer values.
binary_fraction
                  The fraction of total columns that are binary-valued.
binary_ones_fraction
                  The fraction of values in a binary column that are set to 1.
time_fraction
                  The fraction of randomly created date/time columns.
string_fraction
                  The fraction of randomly created string columns.
missing_fraction
                  The fraction of total entries in the data frame that are set to NA.
response_factors
                  If has_response = TRUE, then this is the number of factor levels in the response
                  column.
                  A logical value indicating whether an additional response column should be pre-
has_response
                  pended to the final H2O data frame. If set to TRUE, the total number of columns
                  will be cols+1.
```

A seed used to generate random values when randomize = TRUE.

A seed used to generate random column types when randomize = TRUE.

### Value

seed

Returns an H2OFrame object.

seed\_for\_column\_types

```
\verb|h2o.cross_validation_fold_assignment|\\
```

Retrieve the cross-validation fold assignment

# **Description**

Retrieve the cross-validation fold assignment

# Usage

```
h2o.cross_validation_fold_assignment(object)
```

# Arguments

object

An H2OModel object.

#### Value

Returns a H2OFrame

h2o.cross\_validation\_holdout\_predictions

\*Retrieve the cross-validation holdout predictions\*

# **Description**

Retrieve the cross-validation holdout predictions

# Usage

```
h2o.cross_validation_holdout_predictions(object)
```

# **Arguments**

object An H2OModel object.

### Value

Returns a H2OFrame

```
h2o.cross_validation_models
```

Retrieve the cross-validation models

# **Description**

Retrieve the cross-validation models

# Usage

```
h2o.cross_validation_models(object)
```

## **Arguments**

object An H2OModel object.

### Value

Returns a list of H2OModel objects

```
h2o.cross_validation_predictions
```

Retrieve the cross-validation predictions

# Description

Retrieve the cross-validation predictions

# Usage

```
h2o.cross_validation_predictions(object)
```

# **Arguments**

object An H2OModel object.

### Value

Returns a list of H2OFrame objects

80 h2o.cummin

h2o.cummax

Return the cumulative max over a column or across a row

# **Description**

Return the cumulative max over a column or across a row

# Usage

```
h2o.cummax(x, axis = 0)
```

# **Arguments**

x An H2OFrame object.

An int that indicates whether to do down a column (0) or across a row (1).

# See Also

cummax for the base R implementation.

# **Examples**

h2o.cummin

Return the cumulative min over a column or across a row

# **Description**

Return the cumulative min over a column or across a row

```
h2o.cummin(x, axis = 0)
```

h2o.cumprod 81

# **Arguments**

x An H2OFrame object.

axis An int that indicates whether to do down a column (0) or across a row (1).

### See Also

cummin for the base R implementation.

# **Examples**

h2o.cumprod

Return the cumulative product over a column or across a row

# **Description**

Return the cumulative product over a column or across a row

# Usage

```
h2o.cumprod(x, axis = 0)
```

# Arguments

x An H2OFrame object.

axis An int that indicates whether to do down a column (0) or across a row (1).

# See Also

cumprod for the base R implementation.

82 h2o.cumsum

# **Examples**

h2o.cumsum

Return the cumulative sum over a column or across a row

# **Description**

Return the cumulative sum over a column or across a row

# Usage

```
h2o.cumsum(x, axis = 0)
```

# Arguments

x An H2OFrame object.

An int that indicates whether to do down a column (0) or across a row (1).

### See Also

cumsum for the base R implementation.

h2o.cut 83

h2o.cut

Cut H2O Numeric Data to Factor

# Description

Divides the range of the H2O data into intervals and codes the values according to which interval they fall in. The leftmost interval corresponds to the level one, the next is level two, etc.

## Usage

```
h2o.cut(
  х,
  breaks,
  labels = NULL,
  include.lowest = FALSE,
  right = TRUE,
 dig.lab = 3,
)
## S3 method for class 'H2OFrame'
cut(
 х,
 breaks,
 labels = NULL,
  include.lowest = FALSE,
  right = TRUE,
 dig.lab = 3,
)
```

# **Arguments**

x	An H2OFrame object with a single numeric column.
breaks	A numeric vector of two or more unique cut points.
labels	Labels for the levels of the resulting category. By default, labels are constructed sing "(a,b]" interval notation.
include.lowest	Logical, indicationg if an 'x[i]' equal to the lowest (or highest, for right = FALSE 'breaks' value should be included
right	/codeLogical, indicating if the intervals should be closed on the right (opened on the left) or vice versa.
dig.lab	Integer which is used when labels are not given, determines the number of digits used in formatting the break numbers.
	Further arguments passed to or from other methods.

84 h2o.day

# Value

Returns an H2OFrame object containing the factored data with intervals as levels.

# **Examples**

```
## Not run:
library(h2o)
h2o.init()
iris_hf <- as.h2o(iris)
summary(iris_hf)

# Cut sepal length column into intervals determined by min/max/quantiles
sepal_len_cut <- cut(iris_hf$Sepal.Length, c(4.2, 4.8, 5.8, 6, 8))
head(sepal_len_cut)
summary(sepal_len_cut)

## End(Not run)</pre>
```

h2o.day

Convert Milliseconds to Day of Month in H2O Datasets

# **Description**

Converts the entries of an H2OFrame object from milliseconds to days of the month (on a 1 to 31 scale).

# Usage

```
h2o.day(x)
day(x)
## S3 method for class 'H2OFrame'
day(x)
```

### **Arguments**

Χ

An H2OFrame object.

### Value

An H2OFrame object containing the entries of x converted to days of the month.

#### See Also

```
h2o.month
```

h2o.dayOfWeek 85

h2o.dayOfWeek

Convert Milliseconds to Day of Week in H2O Datasets

# Description

Converts the entries of an H2OFrame object from milliseconds to days of the week (on a 0 to 6 scale).

# Usage

```
h2o.dayOfWeek(x)
dayOfWeek(x)
## S3 method for class 'H2OFrame'
dayOfWeek(x)
```

# **Arguments**

Х

An H2OFrame object.

## Value

An H2OFrame object containing the entries of x converted to days of the week.

# See Also

```
h2o.day,h2o.month
```

h2o.dct

Compute DCT of an H2OFrame

# **Description**

Compute the Discrete Cosine Transform of every row in the H2OFrame

```
h2o.dct(data, destination_frame, dimensions, inverse = FALSE)
```

86 h2o.ddply

# Arguments

### Value

Returns an H2OFrame object.

### **Examples**

h2o.ddply

Split H2O Dataset, Apply Function, and Return Results

# **Description**

For each subset of an H2O data set, apply a user-specified function, then combine the results. This is an experimental feature.

```
h2o.ddply(X, .variables, FUN, ..., .progress = "none")
```

h2o.decryptionSetup 87

# Arguments

Χ	An H2OFrame object to be processed.
.variables	Variables to split X by, either the indices or names of a set of columns.
FUN	Function to apply to each subset grouping.
	Additional arguments passed on to FUN.
.progress	Name of the progress bar to use. #TODO: (Currently unimplemented)

#### Value

Returns an H2OFrame object containing the results from the split/apply operation, arranged

### See Also

ddply for the plyr library implementation.

# **Examples**

```
## Not run:
library(h2o)
h2o.init()

# Import iris dataset to H2O
iris_hf <- as.h2o(iris)

# Add function taking mean of Sepal.Length column
fun <- function(df) { sum(df[, 1], na.rm = TRUE) / nrow(df) }

# Apply function to groups by flower specie
# uses h2o's ddply, since iris_hf is an H2OFrame object
res <- h2o.ddply(iris_hf, "Species", fun)
head(res)

## End(Not run)</pre>
```

h2o.decryptionSetup

Setup a Decryption Tool

# **Description**

If your source file is encrypted - setup a Decryption Tool and then provide the reference (result of this function) to the import functions.

```
h2o.decryptionSetup(
  keystore,
  keystore_type = "JCEKS",
  key_alias = NA_character_,
  password = NA_character_,
```

88 h2o.deepfeatures

```
decrypt_tool = "",
  decrypt_impl = "water.parser.GenericDecryptionTool",
  cipher_spec = NA_character_
)
```

## **Arguments**

keystore An H2OFrame object referencing a loaded Java Keystore (see example).

keystore\_type (Optional) Specification of Keystore type, defaults to JCEKS.

key\_alias Which key from the keystore to use for decryption.

password Password to the keystore and the key.
decrypt\_tool (Optional) Name of the decryption tool.

decrypt\_impl (Optional) Java class name implementing the Decryption Tool. cipher\_spec Specification of a cipher (eg.: AES/ECB/PKCS5Padding).

#### See Also

h2o.importFile, h2o.parseSetup

## **Examples**

```
## Not run:
library(h2o)
h2o.init()
ks_path <- system.file("extdata", "keystore.jks", package = "h2o")
keystore <- h2o.importFile(path = ks_path, parse = FALSE) # don't parse, keep as a binary file
cipher <- "AES/ECB/PKCS5Padding"
pwd <- "Password123"
alias <- "secretKeyAlias"
dt <- h2o.decryptionSetup(keystore, key_alias = alias, password = pwd, cipher_spec = cipher)
data_path <- system.file("extdata", "prostate.csv.aes", package = "h2o")
data <- h2o.importFile(data_path, decrypt_tool = dt)
summary(data)
## End(Not run)</pre>
```

h2o.deepfeatures

Feature Generation via H2O Deep Learning

## **Description**

Extract the non-linear feature from an H2O data set using an H2O deep learning model.

```
h2o.deepfeatures(object, data, layer)
```

### **Arguments**

object An H2OModel object that represents the deep learning model to be used for feature extraction.

data An H2OFrame object.

layer Index (integer) of the hidden layer to extract

#### Value

Returns an H2OFrame object with as many features as the number of units in the hidden layer of the specified index.

#### See Also

h2o.deeplearning for making H2O Deep Learning models.

# **Examples**

h2o.deeplearning

Build a Deep Neural Network model using CPUs

### **Description**

Builds a feed-forward multilayer artificial neural network on an H2OFrame.

```
h2o.deeplearning(

)
```

## **Arguments**

x (Optional) A vector containing the names or indices of the predictor variables to use in building the model. If x is missing, then all columns except y are used.

y The name or column index of the response variable in the data. The response must be either a numeric or a categorical/factor variable. If the response is

> numeric, then a regression model will be trained, otherwise it will train a classification model.

training\_frame Id of the training data frame.

model\_id Destination id for this model; auto-generated if not specified.

validation\_frame

Id of the validation data frame.

nfolds Number of folds for K-fold cross-validation (0 to disable or  $\geq$  2). Defaults to

keep\_cross\_validation\_models

Logical. Whether to keep the cross-validation models. Defaults to TRUE.

keep\_cross\_validation\_predictions

Logical. Whether to keep the predictions of the cross-validation models. Defaults to FALSE.

keep\_cross\_validation\_fold\_assignment

Logical. Whether to keep the cross-validation fold assignment. Defaults to FALSE.

fold\_assignment

Cross-validation fold assignment scheme, if fold\_column is not specified. The 'Stratified' option will stratify the folds based on the response variable, for classification problems. Must be one of: "AUTO", "Random", "Modulo", "Stratified". Defaults to AUTO.

fold\_column Column with cross-validation fold index assignment per observation.

ignore\_const\_cols

Logical. Ignore constant columns. Defaults to TRUE.

score\_each\_iteration

Logical. Whether to score during each iteration of model training. Defaults to FALSE.

weights\_column Column with observation weights. Giving some observation a weight of zero is equivalent to excluding it from the dataset; giving an observation a relative weight of 2 is equivalent to repeating that row twice. Negative weights are not allowed. Note: Weights are per-row observation weights and do not increase the size of the data frame. This is typically the number of times a row is repeated, but non-integer values are supported as well. During training, rows with higher weights matter more, due to the larger loss function pre-factor.

offset\_column Offset column. This will be added to the combination of columns before applying the link function.

balance\_classes

Logical. Balance training data class counts via over/under-sampling (for imbalanced data). Defaults to FALSE.

class\_sampling\_factors

Desired over/under-sampling ratios per class (in lexicographic order). If not specified, sampling factors will be automatically computed to obtain class balance during training. Requires balance\_classes.

max\_after\_balance\_size

Maximum relative size of the training data after balancing class counts (can be less than 1.0). Requires balance\_classes. Defaults to 5.0.

max\_hit\_ratio\_k

Max. number (top K) of predictions to use for hit ratio computation (for multiclass only, 0 to disable). Defaults to 0.

checkpoint Model checkpoint to resume training with.

pretrained\_autoencoder

Pretrained autoencoder model to initialize this model with.

overwrite\_with\_best\_model

Logical. If enabled, override the final model with the best model found during training. Defaults to TRUE.

use\_all\_factor\_levels

Logical. Use all factor levels of categorical variables. Otherwise, the first factor level is omitted (without loss of accuracy). Useful for variable importances and auto-enabled for autoencoder. Defaults to TRUE.

standardize Logical. If enabled, automatically standardize the data. If disabled, the user must provide properly scaled input data. Defaults to TRUE.

Activation function. Must be one of: "Tanh", "TanhWithDropout", "Rectifier",

activation "RectifierWithDropout", "Maxout", "MaxoutWithDropout". Defaults to Rectifier.

Hidden layer sizes (e.g. [100, 100]). Defaults to c(200, 200). hidden

epochs How many times the dataset should be iterated (streamed), can be fractional. Defaults to 10.

train\_samples\_per\_iteration

Number of training samples (globally) per MapReduce iteration. Special values are 0: one epoch, -1: all available data (e.g., replicated training data), -2: automatic. Defaults to -2.

target\_ratio\_comm\_to\_comp

Target ratio of communication overhead to computation. Only for multi-node operation and train\_samples\_per\_iteration = -2 (auto-tuning). Defaults to 0.05.

Seed for random numbers (affects certain parts of the algo that are stochastic seed and those might or might not be enabled by default). Note: only reproducible when running single threaded. Defaults to -1 (time-based random number).

Logical. Adaptive learning rate. Defaults to TRUE. adaptive\_rate

rho Adaptive learning rate time decay factor (similarity to prior updates). Defaults to 0.99.

epsilon Adaptive learning rate smoothing factor (to avoid divisions by zero and allow progress). Defaults to 1e-08.

Learning rate (higher => less stable, lower => slower convergence). Defaults to rate 0.005.

rate\_annealing Learning rate annealing: rate / (1 + rate\_annealing \* samples). Defaults to 1e-

Learning rate decay factor between layers (N-th layer: rate \* rate decay ^ (n rate\_decay 1). Defaults to 1.

momentum\_start Initial momentum at the beginning of training (try 0.5). Defaults to 0.

Number of training samples for which momentum increases. Defaults to 1000000. momentum\_ramp

momentum\_stable

Final momentum after the ramp is over (try 0.99). Defaults to 0.

nesterov\_accelerated\_gradient

Logical. Use Nesterov accelerated gradient (recommended). Defaults to TRUE.

input\_dropout\_ratio

Input layer dropout ratio (can improve generalization, try 0.1 or 0.2). Defaults to 0

hidden\_dropout\_ratios

Hidden layer dropout ratios (can improve generalization), specify one value per hidden layer, defaults to 0.5.

L1 regularization (can add stability and improve generalization, causes many weights to become 0). Defaults to 0.

L2 regularization (can add stability and improve generalization, causes many weights to be small. Defaults to 0.

max\_w2 Constraint for squared sum of incoming weights per unit (e.g. for Rectifier).

Defaults to 3.4028235e+38.

initial\_weight\_distribution

Initial weight distribution. Must be one of: "UniformAdaptive", "Uniform", "Normal". Defaults to UniformAdaptive.

initial\_weight\_scale

Uniform: -value...value, Normal: stddev. Defaults to 1.

initial\_weights

A list of H2OFrame ids to initialize the weight matrices of this model with.

initial\_biases A list of H2OFrame ids to initialize the bias vectors of this model with.

Loss function. Must be one of: "Automatic", "CrossEntropy", "Quadratic", "Huber", "Absolute", "Quantile". Defaults to Automatic.

distribution Distribution function Must be one of: "AUTO", "bernoulli", "multinomial", "gaussian", "poisson", "gamma", "tweedie", "laplace", "quantile", "huber". Defaults to AUTO.

quantile\_alpha Desired quantile for Quantile regression, must be between 0 and 1. Defaults to 0.5.

tweedie\_power Tweedie power for Tweedie regression, must be between 1 and 2. Defaults to 1.5.

huber\_alpha Desired quantile for Huber/M-regression (threshold between quadratic and linear loss, must be between 0 and 1). Defaults to 0.9.

 ${\tt score\_interval} \ \ Shortest\ time\ interval\ (in\ seconds)\ between\ model\ scoring.\ Defaults\ to\ 5.$ 

Number of t

Number of training set samples for scoring (0 for all). Defaults to 10000.

score\_validation\_samples

score\_training\_samples

Number of validation set samples for scoring (0 for all). Defaults to 0.

score\_duty\_cycle

Maximum duty cycle fraction for scoring (lower: more training, higher: more scoring). Defaults to 0.1.

#### classification\_stop

Stopping criterion for classification error fraction on training data (-1 to disable). Defaults to 0.

regression\_stop

Stopping criterion for regression error (MSE) on training data (-1 to disable). Defaults to 1e-06.

stopping\_rounds

Early stopping based on convergence of stopping\_metric. Stop if simple moving average of length k of the stopping\_metric does not improve for k:=stopping\_rounds scoring events (0 to disable) Defaults to 5.

stopping\_metric

Metric to use for early stopping (AUTO: logloss for classification, deviance for regression and anonomaly\_score for Isolation Forest). Note that custom and custom\_increasing can only be used in GBM and DRF with the Python client. Must be one of: "AUTO", "deviance", "logloss", "MSE", "RMSE", "MAE", "RMSLE", "AUC", "AUCPR", "lift\_top\_group", "misclassification", "mean\_per\_class\_error", "custom", "custom\_increasing". Defaults to AUTO.

stopping\_tolerance

Relative tolerance for metric-based stopping criterion (stop if relative improvement is not at least this much) Defaults to 0.

max\_runtime\_secs

Maximum allowed runtime in seconds for model training. Use 0 to disable. Defaults to 0.

score\_validation\_sampling

Method used to sample validation dataset for scoring. Must be one of: "Uniform", "Stratified". Defaults to Uniform.

diagnostics Logical. Enable diagnostics for hidden layers. Defaults to TRUE.

fast\_mode Logical. Enable fast mode (minor approximation in back-propagation). Defaults to TRUE.

force\_load\_balance

Logical. Force extra load balancing to increase training speed for small datasets (to keep all cores busy). Defaults to TRUE.

variable\_importances

Logical. Compute variable importances for input features (Gedeon method) - can be slow for large networks. Defaults to TRUE.

replicate\_training\_data

Logical. Replicate the entire training dataset onto every node for faster training on small datasets. Defaults to TRUE.

single\_node\_mode

Logical. Run on a single node for fine-tuning of model parameters. Defaults to FALSE.

shuffle\_training\_data

Logical. Enable shuffling of training data (recommended if training data is replicated and train\_samples\_per\_iteration is close to #nodes x #rows, of if using balance\_classes). Defaults to FALSE.

missing\_values\_handling

Handling of missing values. Either MeanImputation or Skip. Must be one of: "MeanImputation", "Skip". Defaults to MeanImputation.

quiet\_mode Logical. Enable quiet mode for less output to standard output. Defaults to

FALSE.

autoencoder Logical. Auto-Encoder. Defaults to FALSE.

sparse Logical. Sparse data handling (more efficient for data with lots of 0 values).

Defaults to FALSE.

col\_major Logical. #DEPRECATED Use a column major weight matrix for input layer.

Can speed up forward propagation, but might slow down backpropagation. De-

faults to FALSE.

average\_activation

Average activation for sparse auto-encoder. #Experimental Defaults to 0.

sparsity\_beta Sparsity regularization. #Experimental Defaults to 0.

max\_categorical\_features

Max. number of categorical features, enforced via hashing. #Experimental De-

faults to 2147483647.

reproducible Logical. Force reproducibility on small data (will be slow - only uses 1 thread).

Defaults to FALSE.

export\_weights\_and\_biases

Logical. Whether to export Neural Network weights and biases to H2O Frames.

Defaults to FALSE.

mini\_batch\_size

Mini-batch size (smaller leads to better fit, larger can speed up and generalize

better). Defaults to 1.

categorical\_encoding

Encoding scheme for categorical features Must be one of: "AUTO", "Enum",

"OneHotInternal", "OneHotExplicit", "Binary", "Eigen", "LabelEncoder", "Sort-

ByResponse", "EnumLimited". Defaults to AUTO.

elastic\_averaging

Logical. Elastic averaging between compute nodes can improve distributed

model convergence. #Experimental Defaults to FALSE.

elastic\_averaging\_moving\_rate

Elastic averaging moving rate (only if elastic averaging is enabled). Defaults to

0.9.

elastic\_averaging\_regularization

Elastic averaging regularization strength (only if elastic averaging is enabled).

Defaults to 0.001.

export\_checkpoints\_dir

Automatically export generated models to this directory.

verbose Logical. Print scoring history to the console (Metrics per epoch). Defaults to

FALSE.

h2o.describe 97

### **Examples**

```
## Not run:
library(h2o)
h2o.init()
iris_hf <- as.h2o(iris)
iris_dl <- h2o.deeplearning(x = 1:4, y = 5, training_frame = iris_hf, seed=123456)
# now make a prediction
predictions <- h2o.predict(iris_dl, iris_hf)
## End(Not run)</pre>
```

h2o.describe

H2O Description of A Dataset

# Description

Reports the "Flow" style summary rollups on an instance of H2OFrame. Includes information about column types, mins/maxs/missing/zero counts/stds/number of levels

# Usage

```
h2o.describe(frame)
```

# Arguments

frame

An H2OFrame object.

#### Value

A table with the Frame stats.

```
## Not run:
library(h2o)
h2o.init()
prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.importFile(path = prostate_path)
h2o.describe(prostate)
## End(Not run)</pre>
```

98 h2o.dim

h2o.difflag1

Conduct a lag 1 transform on a numeric H2OFrame column

## Description

Conduct a lag 1 transform on a numeric H2OFrame column

# Usage

```
h2o.difflag1(object)
```

# **Arguments**

object

H2OFrame object

#### Value

Returns an H2OFrame object.

# **Examples**

h2o.dim

Returns the number of rows and columns for an H2OFrame object.

# Description

Returns the number of rows and columns for an H2OFrame object.

```
h2o.dim(x)
```

h2o.dimnames 99

# **Arguments**

Х

An H2OFrame object.

#### See Also

dim for the base R implementation.

# **Examples**

```
## Not run:
library(h2o)
h2o.init()

f <- "https://s3.amazonaws.com/h2o-public-test-data/smalldata/junit/cars_20mpg.csv"
cars <- h2o.importFile(f)
h2o.dim(cars)
## End(Not run)</pre>
```

h2o.dimnames

Column names of an H2OFrame

# **Description**

Column names of an H2OFrame

### Usage

```
h2o.dimnames(x)
```

# Arguments

Χ

An H2OFrame object.

### See Also

dimnames for the base R implementation.

```
## Not run:
library(h2o)
h2o.init()

f <- "https://s3.amazonaws.com/h2o-public-test-data/smalldata/junit/cars_20mpg.csv"
cars <- h2o.importFile(f)
h2o.dimnames(cars)

## End(Not run)</pre>
```

h2o.distance	Compute a pairwise distance measure between all rows of two numeric
	H2OFrames.

# **Description**

Compute a pairwise distance measure between all rows of two numeric H2OFrames.

### Usage

```
h2o.distance(x, y, measure)
```

# **Arguments**

x An H2OFrame object (large, references).
y An H2OFrame object (small, queries).

measure An optional string indicating what distance measure to use. Must be one of:

"11" - Absolute distance (L1-norm, >=0) "12" - Euclidean distance (L2-norm, >=0) "cosine" - Cosine similarity (-1...1) "cosine\_sq" - Squared Cosine similar-

ity (0...1)

# **Examples**

```
## Not run:
library(h2o)
h2o.init()

prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.uploadFile(path = prostate_path)
h2o.distance(prostate[11:30,], prostate[1:10,], "cosine")
## End(Not run)</pre>
```

h2o.downloadAllLogs

Download H2O Log Files to Disk

# Description

h2o.downloadAllLogs downloads all H2O log files to local disk in .zip format. Generally used for debugging purposes.

```
h2o.downloadAllLogs(dirname = ".", filename = NULL)
```

h2o.downloadCSV 101

## **Arguments**

dirname (Optional) A character string indicating the directory that the log file should be

saved in.

filename (Optional) A character string indicating the name that the log file should be

saved to. Note that the saved format is .zip, so the file name must include the

.zip extension.

# **Examples**

```
## Not run:
h2o.downloadAllLogs(dirname='./your_directory_name/', filename = 'autoh2o_log.zip')
## End(Not run)
```

h2o.downloadCSV

Download H2O Data to Disk

### **Description**

Download an H2O data set to a CSV file on the local disk

#### **Usage**

```
h2o.downloadCSV(data, filename)
```

# **Arguments**

data an H2OFrame object to be downloaded.

filename A string indicating the name that the CSV file should be should be saved to.

### Warning

Files located on the H2O server may be very large! Make sure you have enough hard drive space to accommodate the entire file.

```
## Not run:
library(h2o)
h2o.init()
iris_hf <- as.h2o(iris)

file_path <- paste(getwd(), "my_iris_file.csv", sep = .Platform$file.sep)
h2o.downloadCSV(iris_hf, file_path)
file.info(file_path)
file.remove(file_path)

## End(Not run)</pre>
```

102 h2o.download\_mojo

h2o.download\_model

Download the model in binary format. The owner of the file saved is the user by which python session was executed.

# **Description**

Download the model in binary format. The owner of the file saved is the user by which python session was executed.

# Usage

```
h2o.download_model(model, path = NULL)
```

# Arguments

model An H2OModel

path The path where binary file should be downloaded. Downloaded to current di-

rectory by default.

# **Examples**

```
## Not run:
library(h2o)
h <- h2o.init()
fr <- as.h2o(iris)
my_model <- h2o.gbm(x = 1:4, y = 5, training_frame = fr)
h2o.download_model(my_model) # save to the current working directory
## End(Not run)</pre>
```

h2o.download\_mojo

Download the model in MOJO format.

### **Description**

Download the model in MOJO format.

```
h2o.download_mojo(
  model,
  path = getwd(),
  get_genmodel_jar = FALSE,
  genmodel_name = "",
  genmodel_path = ""
)
```

h2o.download\_pojo

# Arguments

model An H2OModel

path The path where MOJO file should be saved. Saved to current directory by default.

get\_genmodel\_jar

If TRUE, then also download h2o-genmodel.jar and store it in either in the same folder

genmodel\_name Custom name of genmodel jar.

genmodel\_path Path to store h2o-genmodel.jar. If left blank and "get\_genmodel\_jar" is TRUE, then the h2o-genmodel.jar

# Value

Name of the MOJO file written to the path.

# **Examples**

```
## Not run:
library(h2o)
h <- h2o.init()
fr <- as.h2o(iris)
my_model <- h2o.gbm(x = 1:4, y = 5, training_frame = fr)
h2o.download_mojo(my_model) # save to the current working directory
## End(Not run)</pre>
```

h2o.download\_pojo

Download the Scoring POJO (Plain Old Java Object) of an H2O Model

Description

Download the Scoring POJO (Plain Old Java Object) of an H2O Model

```
h2o.download_pojo(
  model,
  path = NULL,
  getjar = NULL,
  get_jar = TRUE,
  jar_name = ""
)
```

h2o.entropy

## **Arguments**

model	An H2OModel
path	The path to the directory to store the POJO (no trailing slash). If NULL, then print to to console. The file name will be a compilable java file name.
getjar	(DEPRECATED) Whether to also download the h2o-genmodel.jar file needed to compile the POJO. This argument is now called 'get_jar'.
get_jar	Whether to also download the h2o-genmodel.jar file needed to compile the POJO
jar_name	Custom name of genmodel jar.

### Value

If path is NULL, then pretty print the POJO to the console. Otherwise save it to the specified directory and return POJO file name.

# **Examples**

```
## Not run:
library(h2o)
h <- h2o.init()
fr <- as.h2o(iris)
my_model <- h2o.gbm(x = 1:4, y = 5, training_frame = fr)

h2o.download_pojo(my_model) # print the model to screen
# h2o.download_pojo(my_model, getwd()) # save the POJO and jar file to the current working
# directory, NOT RUN
# h2o.download_pojo(my_model, getwd(), get_jar = FALSE ) # save only the POJO to the current
# working directory, NOT RUN
h2o.download_pojo(my_model, getwd()) # save to the current working directory
## End(Not run)</pre>
```

h2o.entropy	Shannon entropy

# **Description**

Return the Shannon entropy of a string column. If the string is empty, the entropy is 0.

### **Usage**

```
h2o.entropy(x)
```

# **Arguments**

The column on which to calculate the entropy.

h2o.exp

# **Examples**

```
## Not run:
library(h2o)
h2o.init()
buys <- as.h2o(c("no", "no", "yes", "yes", "no", "yes", "no", "yes", "no", "yes", "no"))
buys_entropy <- h2o.entropy(buys)
## End(Not run)</pre>
```

h2o.exp

Compute the exponential function of x

# Description

Compute the exponential function of x

# Usage

```
h2o.exp(x)
```

# Arguments

Х

An H2OFrame object.

#### See Also

exp for the base R implementation.

106 h2o.exportFile

h2o.exportFile	Export an H2O Data Frame (H2OFrame) to a File or to a collection
	of Files.

# Description

Exports an H2OFrame (which can be either VA or FV) to a file. This file may be on the H2O instace's local filesystem, or to HDFS (preface the path with hdfs://) or to S3N (preface the path with s3n://).

# Usage

```
h2o.exportFile(
  data,
  path,
  force = FALSE,
  sep = ",",
  compression = NULL,
  parts = 1
)
```

# Arguments

data	An H2OFrame object.
path	The path to write the file to. Must include the directory and also filename if exporting to a single file. May be prefaced with hdfs:// or s3n://. Each row of data appears as line of the file.
force	logical, indicates how to deal with files that already exist.
sep	The field separator character. Values on each line of the file will be separated by this character (default ",").
compression	How to compress the exported dataset
parts	integer, number of part files to export to. Default is to write to a single file. Large data can be exported to multiple 'part' files, where each part file contains subset of the data. User can specify the maximum number of part files or use value -1 to indicate that H2O should itself determine the optimal number of files. Parameter path will be considered to be a path to a directory if export to multiple part files is desired. Part files conform to naming scheme 'part-m-?????'.

# **Details**

In the case of existing files force = TRUE will overwrite the file. Otherwise, the operation will fail.

h2o.exportHDFS

# **Examples**

```
## Not run:
library(h2o)
h2o.init()
iris_hf <- as.h2o(iris)

# These aren't real paths
# h2o.exportFile(iris_hf, path = "/path/on/h2o/server/filesystem/iris.csv")
# h2o.exportFile(iris_hf, path = "hdfs://path/in/hdfs/iris.csv")
# h2o.exportFile(iris_hf, path = "s3n://path/in/s3/iris.csv")
## End(Not run)</pre>
```

h2o.exportHDFS

Export a Model to HDFS

# Description

Exports an H2OModel to HDFS.

## Usage

```
h2o.exportHDFS(object, path, force = FALSE)
```

# Arguments

object an H2OModel class object.

path The path to write the model to. Must include the driectory and filename.

force logical, indicates how to deal with files that already exist.

```
## Not run:
library(h2o)
h2o.init

f <- "https://s3.amazonaws.com/h2o-public-test-data/smalldata/iris/iris_train.csv"
train <- h2o.importFile(f)
h2o.exportHDFS(train, path = " ", force = FALSE)

## End(Not run)</pre>
```

108 h2o.filterNACols

h2o.fillna fillNA

# **Description**

Fill NA's in a sequential manner up to a specified limit

# Usage

```
h2o.fillna(x, method = "forward", axis = 1, maxlen = 1L)
```

# **Arguments**

x an H2OFrame

method A String: "forward" or "backward"

axis An Integer 1 for row-wise fill (default), 2 for column-wise fill maxlen An Integer for maximum number of consecutive NA's to fill

#### Value

An H2OFrame after filling missing values

# **Examples**

h2o.filterNACols

Filter NA Columns

# **Description**

Filter NA Columns

```
h2o.filterNACols(data, frac = 0.2)
```

h2o.findSynonyms

## Arguments

data A dataset to filter on.

frac The threshold of NAs to allow per column (columns >= this threshold are fil-

tered)

#### Value

Returns a numeric vector of indexes that pertain to non-NA columns

## **Examples**

h2o.findSynonyms

Find synonyms using a word2vec model.

## Description

Find synonyms using a word2vec model.

## Usage

```
h2o.findSynonyms(word2vec, word, count = 20)
```

## **Arguments**

word2vec A word2vec model.

word A single word to find synonyms for.

count The top 'count' synonyms will be returned.

### **Examples**

h2o.find\_row\_by\_threshold

Find the threshold, give the max metric. No duplicate thresholds allowed

### **Description**

Find the threshold, give the max metric. No duplicate thresholds allowed

## Usage

```
h2o.find_row_by_threshold(object, threshold)
```

### **Arguments**

object H2OBinomialMetrics threshold number between 0 and 1

#### **Examples**

```
build_tree_one_node = TRUE , seed = 1234)
perf <- h2o.performance(cars_gbm, cars)
h2o.find_row_by_threshold(perf, 0.5)
## End(Not run)</pre>
```

h2o.find\_threshold\_by\_max\_metric

Find the threshold, give the max metric

## **Description**

Find the threshold, give the max metric

## Usage

```
h2o.find_threshold_by_max_metric(object, metric)
```

## Arguments

object H2OBinomialMetrics
metric "F1," for example

### **Examples**

```
## Not run:
library(h2o)
h2o.init()
f <- "https://s3.amazonaws.com/h2o-public-test-data/smalldata/junit/cars_20mpg.csv"
cars <- h2o.importFile(f)</pre>
cars["economy_20mpg"] <- as.factor(cars["economy_20mpg"])</pre>
predictors <- c("displacement", "power", "weight", "acceleration", "year")</pre>
response <- "economy_20mpg"</pre>
cars.split <- h2o.splitFrame(data = cars,ratios = 0.8, seed = 1234)</pre>
train <- cars.split[[1]]</pre>
valid <- cars.split[[2]]</pre>
cars\_gbm <- h2o.gbm(x = predictors, y = response,
                      training_frame = train, validation_frame = valid,
                     build_tree_one_node = TRUE , seed = 1234)
perf <- h2o.performance(cars_gbm, cars)</pre>
h2o.find_threshold_by_max_metric(perf, "fnr")
## End(Not run)
```

112 h2o.flow

h2o.floor

Take a single numeric argument and return a numeric vector with the largest integers

## **Description**

floor takes a single numeric argument x and returns a numeric vector containing the largest integers not greater than the corresponding elements of x.

## Usage

```
h2o.floor(x)
```

#### **Arguments**

Х

An H2OFrame object.

#### See Also

floor for the base R implementation.

## **Examples**

h2o.flow

Open H2O Flow

## **Description**

Open H2O Flow in your browser

```
h2o.flow()
```

h2o.gainsLift

## **Description**

Retrieve either a single or many Gains/Lift tables from H2O objects.

## Usage

```
h2o.gainsLift(object, ...)
## S4 method for signature 'H2OModel'
h2o.gainsLift(object, newdata, valid = FALSE, xval = FALSE, ...)
## S4 method for signature 'H2OModelMetrics'
h2o.gainsLift(object)
```

## Arguments

object	Either an H2OModel object or an H2OModelMetrics object.
	further arguments to be passed to/from this method.
newdata	An H2OFrame object that can be scored on. Requires a valid response column.
valid	Retrieve the validation metric.
xval	Retrieve the cross-validation metric.

## **Details**

The H2OModelMetrics version of this function will only take H2OBinomialMetrics objects.

## Value

Calling this function on H2OModel objects returns a Gains/Lift table corresponding to the predict function.

#### See Also

predict for generating prediction frames, h2o.performance for creating H2OModelMetrics.

## **Examples**

```
## Not run:
library(h2o)
h2o.init()
prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.uploadFile(prostate_path)
prostate[,2] <- as.factor(prostate[,2])
model <- h2o.gbm(x = 3:9, y = 2, distribution = "bernoulli",</pre>
```

```
training_frame = prostate, validation_frame = prostate, nfolds=3)
h2o.gainsLift(model)  ## extract training metrics
h2o.gainsLift(model, valid=TRUE) ## extract validation metrics (here: the same)
h2o.gainsLift(model, xval =TRUE) ## extract cross-validation metrics
h2o.gainsLift(model, newdata=prostate) ## score on new data (here: the same)
# Generating a ModelMetrics object
perf <- h2o.performance(model, prostate)
h2o.gainsLift(perf)  ## extract from existing metrics object
## End(Not run)
```

h2o.gam

Fit a General Additive Model

## **Description**

Creates a generalized additive model, specified by a response variable, a set of predictors, and a description of the error distribution.

```
h2o.gam(
  Х,
  у,
  training_frame,
  gam_columns,
 model_id = NULL,

#### **Arguments**

x (Optional) A vector containing the names or indices of the predictor variables to use in building the model. If x is missing, then all columns except y are used.

y The name or column index of the response variable in the data. The response must be either a numeric or a categorical/factor variable. If the response is numeric, then a regression model will be trained, otherwise it will train a classification model.

training\_frame Id of the training data frame.

gam\_columns Predictor column names for gam

model\_id Destination id for this model; auto-generated if not specified.

validation\_frame

Id of the validation data frame.

nfolds Number of folds for K-fold cross-validation (0 to disable or  $\geq$  2). Defaults to

0.

seed Seed for random numbers (affects certain parts of the algo that are stochastic

and those might or might not be enabled by default). Defaults to -1 (time-based

random number).

keep\_cross\_validation\_models

Logical. Whether to keep the cross-validation models. Defaults to TRUE.

keep\_cross\_validation\_predictions

Logical. Whether to keep the predictions of the cross-validation models. De-

faults to FALSE.

keep\_cross\_validation\_fold\_assignment

Logical. Whether to keep the cross-validation fold assignment. Defaults to

FALSE.

fold\_assignment

Cross-validation fold assignment scheme, if fold\_column is not specified. The 'Stratified' option will stratify the folds based on the response variable, for classification problems. Must be one of: "AUTO", "Random", "Modulo", "Stratified", Defaults to AUTO.

fied". Defaults to AUTO.

fold\_column Column with cross-validation fold index assignment per observation.

ignore\_const\_cols

Logical. Ignore constant columns. Defaults to TRUE.

score\_each\_iteration

Logical. Whether to score during each iteration of model training. Defaults to

FALSE.

offset\_column Offset column. This will be added to the combination of columns before apply-

ing the link function.

weights\_column Column with observation weights. Giving some observation a weight of zero

is equivalent to excluding it from the dataset; giving an observation a relative weight of 2 is equivalent to repeating that row twice. Negative weights are not allowed. Note: Weights are per-row observation weights and do not increase the size of the data frame. This is typically the number of times a row is repeated, but non-integer values are supported as well. During training, rows with higher

weights matter more, due to the larger loss function pre-factor.

family Family. Use binomial for classification with logistic regression, others are for regression problems. Must be one of: "gaussian", "binomial", "quasibinomial",

"ordinal", "multinomial", "poisson", "gamma", "tweedie", "negativebinomial",

"fractionalbinomial".

tweedie\_variance\_power

Tweedie variance power Defaults to 0.

tweedie\_link\_power

Tweedie link power Defaults to 0.

theta Theta Defaults to 0.

solver AUTO will set the solver based on given data and the other parameters. IRLSM

is fast on on problems with small number of predictors and for lambda-search with L1 penalty, L\_BFGS scales better for datasets with many columns. Must be one of: "AUTO", "IRLSM", "L\_BFGS", "COORDINATE\_DESCENT\_NAIVE",

"COORDINATE\_DESCENT", "GRADIENT\_DESCENT\_LH", "GRADIENT\_DESCENT\_SQERR".

Defaults to AUTO.

alpha Distribution of regularization between the L1 (Lasso) and L2 (Ridge) penalties.

A value of 1 for alpha represents Lasso regression, a value of 0 produces Ridge regression, and anything in between specifies the amount of mixing between the two. Default value of alpha is 0 when SOLVER = 'L-BFGS'; 0.5 otherwise.

lambda Regularization strength

lambda\_search Logical. Use lambda search starting at lambda max, given lambda is then in-

terpreted as lambda min Defaults to FALSE.

early\_stopping Logical. Stop early when there is no more relative improvement on train or

validation (if provided) Defaults to TRUE.

nlambdas Number of lambdas to be used in a search. Default indicates: If alpha is zero,

with lambda search set to True, the value of nlamdas is set to 30 (fewer lambdas

are needed for ridge regression) otherwise it is set to 100. Defaults to -1.

standardize Logical. Standardize numeric columns to have zero mean and unit variance

Defaults to FALSE.

missing\_values\_handling

Handling of missing values. Either MeanImputation, Skip or PlugValues. Must be one of: "MeanImputation", "Skip", "PlugValues". Defaults to MeanImputa-

tion.

plug\_values Plug Values (a single row frame containing values that will be used to im-

pute missing values of the training/validation frame, use with conjunction miss-

ing\_values\_handling = PlugValues)

compute\_p\_values

Logical. Request p-values computation, p-values work only with IRLSM solver

and no regularization Defaults to FALSE.

remove\_collinear\_columns

Logical. In case of linearly dependent columns, remove some of the dependent

columns Defaults to FALSE.

intercept Logical. Include constant term in the model Defaults to TRUE.

non\_negative Logical. Restrict coefficients (not intercept) to be non-negative Defaults to

FALSE.

max\_iterations Maximum number of iterations Defaults to -1.

objective\_epsilon

Converge if objective value changes less than this. Default indicates: If lambda\_search

is set to True the value of objective\_epsilon is set to .0001. If the lambda\_search is set to False and lambda is equal to zero, the value of objective\_epsilon is set to .000001, for any other value of lambda the default value of objective\_epsilon

is set to .0001. Defaults to -1.

beta\_epsilon Converge if beta changes less (using L-infinity norm) than beta esilon, ONLY

applies to IRLSM solver Defaults to 0.0001.

gradient\_epsilon

Converge if objective changes less (using L-infinity norm) than this, ONLY applies to L-BFGS solver. Default indicates: If lambda\_search is set to False and lambda is equal to zero, the default value of gradient\_epsilon is equal to .000001, otherwise the default value is .0001. If lambda\_search is set to True, the conditional values above are 1E-8 and 1E-6 respectively. Defaults to -1.

link Link function. Must be one of: "family\_default", "identity", "logit", "log", "in-

verse", "tweedie", "ologit".

prior Prior probability for y==1. To be used only for logistic regression iff the data has been sampled and the mean of response does not reflect reality. Defaults to

-1.

lambda\_min\_ratio

Minimum lambda used in lambda search, specified as a ratio of lambda\_max (the smallest lambda that drives all coefficients to zero). Default indicates: if the number of observations is greater than the number of variables, then lambda\_min\_ratio is set to 0.0001; if the number of observations is less than the number of variables, then lambda\_min\_ratio is set to 0.01. Defaults to -1.

beta\_constraints

Beta constraints

max\_active\_predictors

Maximum number of active predictors during computation. Use as a stopping criterion to prevent expensive model building with many predictors. Default indicates: If the IRLSM solver is used, the value of max\_active\_predictors is set to 5000 otherwise it is set to 1000000000. Defaults to -1.

interactions A list of predictor column indices to interact. All pairwise combinations will be computed for the list.

interaction\_pairs

A list of pairwise (first order) column interactions.

obj\_reg Likelihood divider in objective value computation, default is 1/nobs Defaults to

export\_checkpoints\_dir

Automatically export generated models to this directory.

balance\_classes

Logical. Balance training data class counts via over/under-sampling (for imbalanced data). Defaults to FALSE.

class\_sampling\_factors

Desired over/under-sampling ratios per class (in lexicographic order). If not specified, sampling factors will be automatically computed to obtain class balance during training. Requires balance\_classes.

max\_after\_balance\_size

Maximum relative size of the training data after balancing class counts (can be less than 1.0). Requires balance\_classes. Defaults to 5.0.

max\_hit\_ratio\_k

Maximum number (top K) of predictions to use for hit ratio computation (for multi-class only, 0 to disable) Defaults to 0.

max\_runtime\_secs

Maximum allowed runtime in seconds for model training. Use 0 to disable. Defaults to 0.

custom\_metric\_func

Reference to custom evaluation function, format: 'language:keyName=funcName'

num\_knots Number of knots for gam predictors

knot\_ids String arrays storing frame keys of knots. One for each gam column specified

in gam\_columns

bs Basis function type for each gam predictors, 0 for cr

scale Smoothing parameter for gam predictors

keep\_gam\_cols Logical. Save keys of model matrix Defaults to FALSE.

## **Examples**

h2o.gbm

Build gradient boosted classification or regression trees

## Description

Builds gradient boosted classification trees and gradient boosted regression trees on a parsed data set. The default distribution function will guess the model type based on the response column type. In order to run properly, the response column must be an numeric for "gaussian" or an enum for "bernoulli" or "multinomial".

)
```

#### **Arguments**

x (Optional) A vector containing the names or indices of the predictor variables to use in building the model. If x is missing, then all columns except y are used.

y The name or column index of the response variable in the data. The response must be either a numeric or a categorical/factor variable. If the response is numeric, then a regression model will be trained, otherwise it will train a classification model.

training\_frame Id of the training data frame.

model\_id Destination id for this model; auto-generated if not specified.

validation\_frame

Id of the validation data frame.

nfolds Number of folds for K-fold cross-validation (0 to disable or  $\geq$  2). Defaults to

keep\_cross\_validation\_models

Logical. Whether to keep the cross-validation models. Defaults to TRUE.

keep\_cross\_validation\_predictions

Logical. Whether to keep the predictions of the cross-validation models. Defaults to FALSE.

keep\_cross\_validation\_fold\_assignment

Logical. Whether to keep the cross-validation fold assignment. Defaults to FALSE.

score\_each\_iteration

Logical. Whether to score during each iteration of model training. Defaults to FALSE.

score\_tree\_interval

Score the model after every so many trees. Disabled if set to 0. Defaults to 0.

fold\_assignment

Cross-validation fold assignment scheme, if fold\_column is not specified. The 'Stratified' option will stratify the folds based on the response variable, for classification problems. Must be one of: "AUTO", "Random", "Modulo", "Stratified". Defaults to AUTO.

fold\_column Column with cross-validation fold index assignment per observation.

ignore\_const\_cols

Logical. Ignore constant columns. Defaults to TRUE.

offset\_column Offset column. This will be added to the combination of columns before applying the link function.

weights\_column Column with observation weights. Giving some observation a weight of zero

is equivalent to excluding it from the dataset; giving an observation a relative weight of 2 is equivalent to repeating that row twice. Negative weights are not allowed. Note: Weights are per-row observation weights and do not increase the size of the data frame. This is typically the number of times a row is repeated, but non-integer values are supported as well. During training, rows with higher weights matter more, due to the larger loss function pre-factor.

balance\_classes

Logical. Balance training data class counts via over/under-sampling (for imbalanced data). Defaults to FALSE.

class\_sampling\_factors

Desired over/under-sampling ratios per class (in lexicographic order). If not specified, sampling factors will be automatically computed to obtain class balance during training. Requires balance\_classes.

max\_after\_balance\_size

Maximum relative size of the training data after balancing class counts (can be less than 1.0). Requires balance classes. Defaults to 5.0.

max\_hit\_ratio\_k

Max. number (top K) of predictions to use for hit ratio computation (for multiclass only, 0 to disable) Defaults to 0.

ntrees Number of trees. Defaults to 50.

max\_depth Maximum tree depth. Defaults to 5.

min\_rows Fewest allowed (weighted) observations in a leaf. Defaults to 10.

Defaults to 1.797693135e+308.

nbins For numerical columns (real/int), build a histogram of (at least) this many bins, then split at the best point Defaults to 20.

nbins\_top\_level

For numerical columns (real/int), build a histogram of (at most) this many bins at the root level, then decrease by factor of two per level Defaults to 1024.

nbins\_cats For categorical columns (factors), build a histogram of this many bins, then split at the best point. Higher values can lead to more overfitting. Defaults to 1024.

r2\_stopping r2\_stopping is no longer supported and will be ignored if set - please use stopping\_rounds, stopping\_metric and stopping\_tolerance instead. Previous version of H2O would stop making trees when the R^2 metric equals or exceeds this

stopping\_rounds

Early stopping based on convergence of stopping\_metric. Stop if simple moving average of length k of the stopping\_metric does not improve for k:=stopping\_rounds scoring events (0 to disable) Defaults to 0.

stopping\_metric

Metric to use for early stopping (AUTO: logloss for classification, deviance for regression and anonomaly\_score for Isolation Forest). Note that custom and custom\_increasing can only be used in GBM and DRF with the Python client. Must be one of: "AUTO", "deviance", "logloss", "MSE", "RMSE",

"MAE", "RMSLE", "AUC", "AUCPR", "lift\_top\_group", "misclassification", "mean\_per\_class\_error", "custom", "custom\_increasing". Defaults to AUTO.

stopping\_tolerance

Relative tolerance for metric-based stopping criterion (stop if relative improvement is not at least this much) Defaults to 0.001.

max\_runtime\_secs

Maximum allowed runtime in seconds for model training. Use 0 to disable. Defaults to 0.

Seed for random numbers (affects certain parts of the algo that are stochastic and those might or might not be enabled by default). Defaults to -1 (time-based random number).

build\_tree\_one\_node

Logical. Run on one node only; no network overhead but fewer cpus used. Suitable for small datasets. Defaults to FALSE.

learn\_rate Learning rate (from 0.0 to 1.0) Defaults to 0.1.

learn\_rate\_annealing

Scale the learning rate by this factor after each tree (e.g., 0.99 or 0.999) Defaults to 1.

distribution Distribution function Must be one of: "AUTO", "bernoulli", "quasibinomial", "multinomial", "gaussian", "poisson", "gamma", "tweedie", "laplace", "quantile", "huber", "custom". Defaults to AUTO.

quantile\_alpha Desired quantile for Quantile regression, must be between 0 and 1. Defaults to 0.5.

tweedie\_power Tweedie power for Tweedie regression, must be between 1 and 2. Defaults to 1.5.

huber\_alpha Desired quantile for Huber/M-regression (threshold between quadratic and linear loss, must be between 0 and 1). Defaults to 0.9.

checkpoint Model checkpoint to resume training with.

sample\_rate Row sample rate per tree (from 0.0 to 1.0) Defaults to 1.

sample\_rate\_per\_class

A list of row sample rates per class (relative fraction for each class, from 0.0 to 1.0), for each tree

col\_sample\_rate

Column sample rate (from 0.0 to 1.0) Defaults to 1.

col\_sample\_rate\_change\_per\_level

Relative change of the column sampling rate for every level (must be > 0.0 and <= 2.0) Defaults to 1.

col\_sample\_rate\_per\_tree

Column sample rate per tree (from 0.0 to 1.0) Defaults to 1.

min\_split\_improvement

Minimum relative improvement in squared error reduction for a split to happen Defaults to 1e-05.

histogram\_type What type of histogram to use for finding optimal split points Must be one of: "AUTO", "UniformAdaptive", "Random", "QuantilesGlobal", "RoundRobin". Defaults to AUTO.

max\_abs\_leafnode\_pred

Maximum absolute value of a leaf node prediction Defaults to 1.797693135e+308.

pred\_noise\_bandwidth

Bandwidth (sigma) of Gaussian multiplicative noise  $\sim$ N(1,sigma) for tree node predictions Defaults to 0.

categorical\_encoding

Encoding scheme for categorical features Must be one of: "AUTO", "Enum", "OneHotInternal", "OneHotExplicit", "Binary", "Eigen", "LabelEncoder", "Sort-ByResponse", "EnumLimited". Defaults to AUTO.

calibrate\_model

Logical. Use Platt Scaling to calculate calibrated class probabilities. Calibration can provide more accurate estimates of class probabilities. Defaults to FALSE.

calibration\_frame

Calibration frame for Platt Scaling

custom\_metric\_func

 $\label{lem:continuous} Reference \ to \ custom \ evaluation \ function, form at: \ `language: key Name=func Name` \ custom\_distribution\_func$ 

Reference to custom distribution, format: 'language:keyName=funcName' export\_checkpoints\_dir

Automatically export generated models to this directory.

monotone\_constraints

A mapping representing monotonic constraints. Use +1 to enforce an increasing constraint and -1 to specify a decreasing constraint.

check\_constant\_response

Logical. Check if response column is constant. If enabled, then an exception is thrown if the response column is a constant value. If disabled, then model will train regardless of the response column being a constant value or not. Defaults to TRUE.

verbose

Logical. Print scoring history to the console (Metrics per tree). Defaults to FALSE.

h2o.generic 125

h2o.generic

Imports a generic model into H2O. Such model can be used then used for scoring and obtaining additional information about the model. The imported model has to be supported by H2O.

#### **Description**

Imports a generic model into H2O. Such model can be used then used for scoring and obtaining additional information about the model. The imported model has to be supported by H2O.

## Usage

```
h2o.generic(model_id = NULL, model_key = NULL, path = NULL)
```

## **Arguments**

model\_id Destination id for this model; auto-generated if not specified.

model\_key Key to the self-contained model archive already uploaded to H2O.

Path to file with self-contained model archive.

## Examples

```
## Not run:
# library(h2o)
# h2o.init()

# generic_model <- h2o.genericModel("/path/to/model.zip")
# predictions <- h2o.predict(generic_model, dataset)

## End(Not run)</pre>
```

h2o.genericModel

Imports a model under given path, creating a Generic model with it.

### Description

Usage example: generic\_model <- h2o.genericModel(model\_file\_path = "/path/to/mojo.zip") predictions <- h2o.predict(generic\_model, dataset)

```
h2o.genericModel(mojo_file_path)
```

h2o.getConnection

### **Arguments**

```
mojo_file_path Filesystem path to the model imported
```

#### Value

Returns H2O Generic Model based on given embedded model

## **Examples**

```
## Not run:
# Import default Iris dataset as H2O frame
data <- as.h2o(iris)

# Train a very simple GBM model
features <- c("Sepal.Length", "Sepal.Length", "Sepal.Width", "Petal.Length", "Petal.Width")
original_model <- h2o.gbm(x=features, y = "Species", training_frame = data)

# Download the trained GBM model as MOJO (temporary directory used in this example)
mojo_original_name <- h2o.download_mojo(model = original_model, path = tempdir())
mojo_original_path <- paste0(tempdir(),"/",mojo_original_name)

# Import the MOJO as Generic model
generic_model <- h2o.genericModel(mojo_original_path)

# Perform scoring with the generic model
generic_model_predictions <- h2o.predict(generic_model, data)

## End(Not run)</pre>
```

h2o.getConnection

Retrieve an H2O Connection

# Description

Attempt to recover an h2o connection.

## Usage

```
h2o.getConnection()
```

## Value

Returns an H2OConnection object.

h2o.getFrame

h2o.getFrame

Get an R Reference to an H2O Dataset, that will NOT be GC'd by default

### Description

Get the reference to a frame with the given id in the H2O instance.

#### Usage

```
h2o.getFrame(id)
```

#### **Arguments**

iА

A string indicating the unique frame of the dataset to retrieve.

### **Examples**

```
## Not run:
library(h2o)
h2o.init()
f <- "http://h2o-public-test-data.s3.amazonaws.com/smalldata/iris/iris_train.csv"</pre>
train <- h2o.importFile(f)</pre>
y <- "species"
x <- setdiff(names(train), y)</pre>
train[,y] <- as.factor(train[,y])</pre>
nfolds <- 5
num_base_models <- 2
my_gbm \leftarrow h2o.gbm(x = x, y = y, training_frame = train,
                   distribution = "multinomial", ntrees = 10,
                   max_depth = 3, min_rows = 2, learn_rate = 0.2,
                   nfolds = nfolds, fold_assignment = "Modulo",
                   keep_cross_validation_predictions = TRUE, seed = 1)
my_rf \leftarrow h2o.randomForest(x = x, y = y, training_frame = train,
                           ntrees = 50, nfolds = nfolds, fold_assignment = "Modulo",
                           keep_cross_validation_predictions = TRUE, seed = 1)
stack <- h2o.stackedEnsemble(x = x, y = y, training_frame = train,</pre>
                              model_id = "my_ensemble_l1",
                              base_models = list(my_gbm@model_id, my_rf@model_id),
                              keep_levelone_frame = TRUE)
h2o.getFrame(stack@model$levelone_frame_id$name)
## End(Not run)
```

h2o.getGrid

h2o.getGLMFullRegularizationPath

Extract full regularization path from a GLM model

## **Description**

Extract the full regularization path from a GLM model (assuming it was run with the lambda search option).

## Usage

h2o.getGLMFullRegularizationPath(model)

## Arguments

model an H2OModel corresponding from a h2o.glm call.

h2o.getGrid

Get a grid object from H2O distributed K/V store.

## **Description**

Note that if neither cross-validation nor a validation frame is used in the grid search, then the training metrics will display in the "get grid" output. If a validation frame is passed to the grid, and nfolds = 0, then the validation metrics will display. However, if nfolds > 1, then cross-validation metrics will display even if a validation frame is provided.

## Usage

```
h2o.getGrid(grid_id, sort_by, decreasing, verbose = FALSE)
```

# Arguments

grid_id	ID of existing grid object to fetch
sort_by	Sort the models in the grid space by a metric. Choices are "logloss", "residual_deviance", "mse", "accuracy", "precision", "recall", "f1", etc.
decreasing	Specify whether sort order should be decreasing
verbose	Controls verbosity of the output, if enabled prints out error messages for failed models (default: FALSE)

h2o.getId

## **Examples**

h2o.getId

Get back-end distributed key/value store id from an H2OFrame.

## **Description**

Get back-end distributed key/value store id from an H2OFrame.

#### Usage

```
h2o.getId(x)
```

#### **Arguments**

Х

An H2OFrame

#### Value

The id of the H2OFrame

#### **Examples**

```
## Not run:
library(h2o)
h2o.init()

f <- "http://h2o-public-test-data.s3.amazonaws.com/smalldata/iris/iris_train.csv"
iris <- h2o.importFile(f)
h2o.getId(iris)

## End(Not run)</pre>
```

h2o.getModelTree

h2o.getModel

Get an R reference to an H2O model

## **Description**

Returns a reference to an existing model in the H2O instance.

# Usage

```
h2o.getModel(model_id)
```

## **Arguments**

model\_id

A string indicating the unique model\_id of the model to retrieve.

#### Value

Returns an object that is a subclass of H2OModel.

### **Examples**

```
## Not run:
library(h2o)
h2o.init()

iris_hf <- as.h2o(iris)
model_id <- h2o.gbm(x = 1:4, y = 5, training_frame = iris_hf)@model_id
model_retrieved <- h2o.getModel(model_id)

## End(Not run)</pre>
```

h2o.getModelTree

Fetchces a single tree of a H2O model. This function is intended to be used on Gradient Boosting Machine models or Distributed Random Forest models.

## **Description**

Fetchces a single tree of a H2O model. This function is intended to be used on Gradient Boosting Machine models or Distributed Random Forest models.

```
h2o.getModelTree(model, tree_number, tree_class = NA)
```

h2o.getTimezone 131

#### **Arguments**

model Model with trees

tree\_number Number of the tree in the model to fetch, starting with 1

tree\_class Name of the class of the tree (if applicable). This value is ignored for regression

and binomial response column, as there is only one tree built. As there is exactly one class per categorical level, name of tree's class equals to the corresponding

categorical level of response column.

#### Value

Returns an H2OTree object with detailed information about a tree.

### **Examples**

```
## Not run:
library(h2o)
h2o.init()

f <- "http://h2o-public-test-data.s3.amazonaws.com/smalldata/iris/iris_train.csv"
iris <- h2o.importFile(f)
gbm_model <- h2o.gbm(y = "species", training_frame = iris)
tree <- h2o.getModelTree(gbm_model, 1, "Iris-setosa")

## End(Not run)</pre>
```

h2o.getTimezone

Get the Time Zone on the H2O cluster Returns a string

## Description

Get the Time Zone on the H2O cluster Returns a string

```
h2o.getTimezone()
```

h2o.getVersion

h2o.getTypes

Get the types-per-column

# Description

Get the types-per-column

## Usage

```
h2o.getTypes(x)
```

# Arguments

Х

An H2OFrame

## Value

A list of types per column

# **Examples**

```
## Not run:
library(h2o)
h2o.init()

f <- "http://h2o-public-test-data.s3.amazonaws.com/smalldata/iris/iris_train.csv"
iris <- h2o.importFile(f)
h2o.getTypes(iris)

## End(Not run)</pre>
```

h2o.getVersion

Get h2o version

## Description

Get h2o version

```
h2o.getVersion()
```

h2o.get\_automl

h2o.get\_automl

Get an R object that is a subclass of H2OAutoML

## **Description**

Get an R object that is a subclass of H2OAutoML

#### Usage

```
h2o.get_automl(project_name)
h2o.getAutoML(project_name)
```

## **Arguments**

project\_name A string indicating the project\_name of the automl instance to retrieve.

#### Value

Returns an object that is a subclass of H2OAutoML.

#### **Examples**

h2o.get\_leaderboard

Retrieve the leaderboard from the AutoML instance.

## **Description**

Contrary to the default leaderboard attached to the automl instance, this one can return columns other than the metrics.

```
h2o.get_leaderboard(object, extra_columns = NULL)
```

#### **Arguments**

object The object for which to return the leaderboard. Currently, only H2OAutoML

instances are supported.

extra\_columns A string or a list of string specifying which optional columns should be added to the leaderboard. Defaults to None. Currently supported extensions are:

• 'ALL': adds all columns below.

- 'training\_time\_ms': column providing the training time of each model in milliseconds (doesn't include the training of cross validation models).
- 'predict\_time\_per\_row\_ms': column providing the average prediction time by the model for a single row.

#### Value

An H2OFrame representing the leaderboard.

### **Examples**

h2o.get\_ntrees\_actual Retrieve actual number of trees for tree algorithms

## **Description**

Retrieve actual number of trees for tree algorithms

## Usage

```
h2o.get_ntrees_actual(object)
```

## **Arguments**

object An H2OModel object.

```
h2o.get_segment_models
```

Retrieves an instance of H2OSegmentModels for a given id.

#### **Description**

Retrieves an instance of H2OSegmentModels for a given id.

### Usage

```
h2o.get_segment_models(segment_models_id)
```

### **Arguments**

```
segment_models_id
```

A string indicating the unique segment\_models\_id

#### Value

Returns an object that is a subclass of H2OSegmentModels.

#### **Examples**

h2o.giniCoef

Retrieve the GINI Coefficcient

## Description

Retrieves the GINI coefficient from an H2OBinomialMetrics. If "train", "valid", and "xval" parameters are FALSE (default), then the training GINIvalue is returned. If more than one parameter is set to TRUE, then a named vector of GINIs are returned, where the names are "train", "valid" or "xval".

#### Usage

```
h2o.giniCoef(object, train = FALSE, valid = FALSE, xval = FALSE)
```

#### **Arguments**

object an H2OBinomialMetrics object.

train Retrieve the training GINI Coefficcient

valid Retrieve the validation GINI Coefficcient

xval Retrieve the cross-validation GINI Coefficcient

#### See Also

h2o.auc for AUC, h2o.giniCoef for the GINI coefficient, and h2o.metric for the various threshold metrics. See h2o.performance for creating H2OModelMetrics objects.

## **Examples**

```
## Not run:
library(h2o)
h2o.init()

prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.uploadFile(prostate_path)

prostate[,2] <- as.factor(prostate[,2])
model <- h2o.gbm(x = 3:9, y = 2, training_frame = prostate, distribution = "bernoulli")
perf <- h2o.performance(model, prostate)
h2o.giniCoef(perf)

## End(Not run)</pre>
```

h2o.glm

Fit a generalized linear model

### **Description**

Fits a generalized linear model, specified by a response variable, a set of predictors, and a description of the error distribution.

```
h2o.glm(
    x,
    y,
    training_frame,
    model_id = NULL,

)
```

#### **Arguments**

У

(Optional) A vector containing the names or indices of the predictor variables to Х use in building the model. If x is missing, then all columns except y are used.

The name or column index of the response variable in the data. The response must be either a numeric or a categorical/factor variable. If the response is numeric, then a regression model will be trained, otherwise it will train a classification model.

training\_frame Id of the training data frame.

model\_id Destination id for this model; auto-generated if not specified.

validation\_frame

Id of the validation data frame.

nfolds Number of folds for K-fold cross-validation (0 to disable or  $\geq$  2). Defaults to

Seed for random numbers (affects certain parts of the algo that are stochastic seed

and those might or might not be enabled by default). Defaults to -1 (time-based random number).

keep\_cross\_validation\_models

Logical. Whether to keep the cross-validation models. Defaults to TRUE.

keep\_cross\_validation\_predictions

Logical. Whether to keep the predictions of the cross-validation models. Defaults to FALSE.

keep\_cross\_validation\_fold\_assignment

Logical. Whether to keep the cross-validation fold assignment. Defaults to FALSE.

fold\_assignment

Cross-validation fold assignment scheme, if fold\_column is not specified. The 'Stratified' option will stratify the folds based on the response variable, for classification problems. Must be one of: "AUTO", "Random", "Modulo", "Stratified". Defaults to AUTO.

fold\_column Column with cross-validation fold index assignment per observation.

random\_columns random columns indices for HGLM.

ignore\_const\_cols

Logical. Ignore constant columns. Defaults to TRUE.

score\_each\_iteration

Logical. Whether to score during each iteration of model training. Defaults to FALSE.

offset\_column Offset column. This will be added to the combination of columns before apply-

ing the link function.

weights\_column Column with observation weights. Giving some observation a weight of zero

is equivalent to excluding it from the dataset; giving an observation a relative weight of 2 is equivalent to repeating that row twice. Negative weights are not allowed. Note: Weights are per-row observation weights and do not increase the size of the data frame. This is typically the number of times a row is repeated, but non-integer values are supported as well. During training, rows with higher

weights matter more, due to the larger loss function pre-factor.

family Family. Use binomial for classification with logistic regression, others are for

regression problems. Must be one of: "gaussian", "binomial", "fractionalbinomial", "quasibinomial", "ordinal", "multinomial", "poisson", "gamma", "tweedie",

"negativebinomial". Defaults to gaussian.

rand\_family Random Component Family array. One for each random component. Only

support gaussian for now. Must be one of: "[gaussian]".

tweedie\_variance\_power

Tweedie variance power Defaults to 0.

tweedie\_link\_power

Tweedie link power Defaults to 1.

theta Theta Defaults to 1e-10.

solver AUTO will set the solver based on given data and the other parameters. IRLSM

is fast on on problems with small number of predictors and for lambda-search with L1 penalty, L\_BFGS scales better for datasets with many columns. Must be one of: "AUTO", "IRLSM", "L BFGS", "COORDINATE DESCENT NAIVE",

"COORDINATE\_DESCENT", "GRADIENT\_DESCENT\_LH", "GRADIENT\_DESCENT\_SQERR".

Defaults to AUTO.

alpha Distribution of regularization between the L1 (Lasso) and L2 (Ridge) penalties.

A value of 1 for alpha represents Lasso regression, a value of 0 produces Ridge regression, and anything in between specifies the amount of mixing between the two. Default value of alpha is 0 when SOLVER = 'L-BFGS'; 0.5 otherwise.

lambda Regularization strength

lambda\_search Logical. Use lambda search starting at lambda max, given lambda is then in-

terpreted as lambda min Defaults to FALSE.

early\_stopping Logical. Stop early when there is no more relative improvement on train or

validation (if provided) Defaults to TRUE.

nlambdas Number of lambdas to be used in a search. Default indicates: If alpha is zero,

with lambda search set to True, the value of nlamdas is set to 30 (fewer lambdas are needed for ridge regression) otherwise it is set to 100. Defaults to -1.

standardize Logical. Standardize numeric columns to have zero mean and unit variance

Defaults to TRUE.

missing\_values\_handling

Handling of missing values. Either MeanImputation, Skip or PlugValues. Must be one of: "MeanImputation", "Skip", "PlugValues". Defaults to MeanImputa-

tion.

plug\_values

Plug Values (a single row frame containing values that will be used to impute missing values of the training/validation frame, use with conjunction missing\_values\_handling = PlugValues)

compute\_p\_values

Logical. Request p-values computation, p-values work only with IRLSM solver and no regularization Defaults to FALSE.

remove\_collinear\_columns

Logical. In case of linearly dependent columns, remove some of the dependent columns Defaults to FALSE.

intercept

Logical. Include constant term in the model Defaults to TRUE.

non\_negative

Logical. Restrict coefficients (not intercept) to be non-negative Defaults to FALSE.

max\_iterations Maximum number of iterations Defaults to -1.

objective\_epsilon

Converge if objective value changes less than this. Default indicates: If lambda\_search is set to True the value of objective\_epsilon is set to .0001. If the lambda\_search is set to False and lambda is equal to zero, the value of objective\_epsilon is set to .000001, for any other value of lambda the default value of objective\_epsilon is set to .0001. Defaults to -1.

beta\_epsilon

Converge if beta changes less (using L-infinity norm) than beta esilon, ONLY applies to IRLSM solver Defaults to 0.0001.

gradient\_epsilon

Converge if objective changes less (using L-infinity norm) than this, ONLY applies to L-BFGS solver. Default indicates: If lambda\_search is set to False and lambda is equal to zero, the default value of gradient\_epsilon is equal to .000001, otherwise the default value is .0001. If lambda\_search is set to True, the conditional values above are 1E-8 and 1E-6 respectively. Defaults to -1.

link

Link function. Must be one of: "family\_default", "identity", "logit", "log", "inverse", "tweedie", "ologit". Defaults to family\_default.

rand\_link

Link function array for random component in HGLM. Must be one of: "[identity]", "[family\_default]".

startval

double array to initialize fixed and random coefficients for HGLM.

calc\_like

Logical. if true, will return likelihood function value for HGLM. Defaults to FALSE.

**HGLM** 

Logical. If set to true, will return HGLM model. Otherwise, normal GLM model will be returned Defaults to FALSE.

prior

Prior probability for y==1. To be used only for logistic regression iff the data has been sampled and the mean of response does not reflect reality. Defaults to -1

lambda\_min\_ratio

Minimum lambda used in lambda search, specified as a ratio of lambda\_max (the smallest lambda that drives all coefficients to zero). Default indicates: if the number of observations is greater than the number of variables, then lambda\_min\_ratio is set to 0.0001; if the number of observations is less than the number of variables, then lambda\_min\_ratio is set to 0.01. Defaults to -1.

beta\_constraints

Beta constraints

max\_active\_predictors

Maximum number of active predictors during computation. Use as a stopping criterion to prevent expensive model building with many predictors. Default indicates: If the IRLSM solver is used, the value of max\_active\_predictors is set to 5000 otherwise it is set to 1000000000. Defaults to -1.

interactions

A list of predictor column indices to interact. All pairwise combinations will be computed for the list.

interaction\_pairs

A list of pairwise (first order) column interactions.

obj\_reg

Likelihood divider in objective value computation, default is 1/nobs Defaults to \_1

export\_checkpoints\_dir

Automatically export generated models to this directory.

balance\_classes

Logical. Balance training data class counts via over/under-sampling (for imbalanced data). Defaults to FALSE.

class\_sampling\_factors

Desired over/under-sampling ratios per class (in lexicographic order). If not specified, sampling factors will be automatically computed to obtain class balance during training. Requires balance\_classes.

max\_after\_balance\_size

Maximum relative size of the training data after balancing class counts (can be less than 1.0). Requires balance\_classes. Defaults to 5.0.

max\_hit\_ratio\_k

Maximum number (top K) of predictions to use for hit ratio computation (for multi-class only, 0 to disable) Defaults to 0.

max\_runtime\_secs

Maximum allowed runtime in seconds for model training. Use 0 to disable. Defaults to 0.

custom\_metric\_func

Reference to custom evaluation function, format: 'language:keyName=funcName'

#### Value

A subclass of H20Model is returned. The specific subclass depends on the machine learning task at hand (if it's binomial classification, then an H20BinomialModel is returned, if it's regression then a H20RegressionModel is returned). The default print- out of the models is shown, but further GLM-specifc information can be queried out of the object. To access these various items, please refer to the seealso section below. Upon completion of the GLM, the resulting object has coefficients, normalized coefficients, residual/null deviance, aic, and a host of model metrics including MSE, AUC (for logistic regression), degrees of freedom, and confusion matrices. Please refer to the more in-depth GLM documentation available here: https://h2o-release.s3.amazonaws.com/h2o-dev/rel-shannon/2/docs-website/h2o-docs/index.html#Data+Science+Algorithms-GLM

     user_x = NULL,
      expand_user_y = TRUE,
      impute_original = FALSE,
      recover_svd = FALSE,
     max_runtime_secs = 0,
     export_checkpoints_dir = NULL
   )
Arguments
    training_frame Id of the training data frame.
   cols
                    (Optional) A vector containing the data columns on which k-means operates.
                    Destination id for this model; auto-generated if not specified.
   model id
    validation_frame
                    Id of the validation data frame.
    ignore_const_cols
                    Logical. Ignore constant columns. Defaults to TRUE.
```

loading\_name Frame key to save resulting X
transform Transformation of training data Must be one of: "NONE", "STANDARDIZE",
"NORMALIZE", "DEMEAN", "DESCALE". Defaults to NONE.

Logical. Whether to score during each iteration of model training. Defaults to

score\_each\_iteration

FALSE.

k Rank of matrix approximation Defaults to 1.

loss Numeric loss function Must be one of: "Quadratic", "Absolute", "Huber", "Pois-

son", "Hinge", "Logistic", "Periodic". Defaults to Quadratic.

loss\_by\_col Loss function by column (override) Must be one of: "Quadratic", "Absolute",

"Huber", "Poisson", "Hinge", "Logistic", "Periodic", "Categorical", "Ordinal".

loss\_by\_col\_idx

Loss function by column index (override)

multi\_loss Categorical loss function Must be one of: "Categorical", "Ordinal". Defaults to

Categorical.

period Length of period (only used with periodic loss function) Defaults to 1.

regularization\_x

Regularization function for X matrix Must be one of: "None", "Quadratic", "L2", "L1", "NonNegative", "OneSparse", "UnitOneSparse", "Simplex". De-

faults to None.

regularization\_y

Regularization function for Y matrix Must be one of: "None", "Quadratic", "L2", "L1", "NonNegative", "OneSparse", "UnitOneSparse", "Simplex". De-

faults to None.

gamma\_x Regularization weight on X matrix Defaults to 0.
gamma\_y Regularization weight on Y matrix Defaults to 0.
max\_iterations Maximum number of iterations Defaults to 1000.

max\_updates Maximum number of updates, defaults to 2\*max\_iterations Defaults to 2000.

init\_step\_size Initial step size Defaults to 1.

min\_step\_size Minimum step size Defaults to 0.0001.

seed Seed for random numbers (affects certain parts of the algo that are stochastic

and those might or might not be enabled by default). Defaults to -1 (time-based

random number).

init Initialization mode Must be one of: "Random", "SVD", "PlusPlus", "User".

Defaults to PlusPlus.

svd\_method Method for computing SVD during initialization (Caution: Randomized is cur-

rently experimental and unstable) Must be one of: "GramSVD", "Power", "Ran-

domized". Defaults to Randomized.

user\_y User-specified initial Y user\_x User-specified initial X

expand\_user\_y Logical. Expand categorical columns in user-specified initial Y Defaults to

TRUE.

impute\_original

Logical. Reconstruct original training data by reversing transform Defaults to

FALSI

recover\_svd Logical. Recover singular values and eigenvectors of XY Defaults to FALSE.

max\_runtime\_secs

Maximum allowed runtime in seconds for model training. Use 0 to disable. Defaults to 0.

Detaults

export\_checkpoints\_dir

Automatically export generated models to this directory.

h2o.grep 145

### Value

an object of class H2ODimReductionModel.

### References

h2o.kmeans, h2o.svd, h2o.prcomp
```

## **Examples**

h2o.grep

Search for matches to an argument pattern

## **Description**

Searches for matches to argument 'pattern' within each element of a string column.

```
h2o.grep(
  pattern,
  x,
  ignore.case = FALSE,
  invert = FALSE,
  output.logical = FALSE)
```

146 h2o.grid

# Arguments

pattern A character string containing a regular expression.

x An H2O frame that wraps a single string column.

ignore.case If TRUE case is ignored during matching.

invert Identify elements that do not match the pattern.

output.logical If TRUE returns logical vector of indicators instead of list of matching positions

## **Details**

This function has similar semantics as R's native grep function and it supports a subset of its parameters. Default behavior is to return indices of the elements matching the pattern. Parameter 'output.logical' can be used to return a logical vector indicating if the element matches the pattern (1) or not (0).

## Value

H2OFrame holding the matching positions or a logical vector if 'output.logical' is enabled.

### **Examples**

```
## Not run:
library(h2o)
h2o.init()
addresses <- as.h2o(c("2307", "Leghorn St", "Mountain View", "CA", "94043"))
zip.codes <- addresses[h2o.grep("[0-9]{5}", addresses, output.logical = TRUE),]
## End(Not run)</pre>
```

h2o.grid

H2O Grid Support

### **Description**

Provides a set of functions to launch a grid search and get its results.

```
h2o.grid(
  algorithm,
  grid_id,
  x,
  y,
  training_frame,
  ...,
  hyper_params = list(),
  is_supervised = NULL,
```

147 h2o.grid

```
do_hyper_params_check = FALSE,
  search_criteria = NULL,
  export_checkpoints_dir = NULL,
 parallelism = 1
)
```

## **Arguments**

algorithm Name of algorithm to use in grid search (gbm, randomForest, kmeans, glm, deeplearning, naivebayes, pca). grid\_id (Optional) ID for resulting grid search. If it is not specified then it is autogenerated. (Optional) A vector containing the names or indices of the predictor variables to X use in building the model. If x is missing, then all columns except y are used. y The name or column index of the response variable in the data. The response must be either a numeric or a categorical/factor variable. If the response is numeric, then a regression model will be trained, otherwise it will train a classification model.

training\_frame Id of the training data frame.

arguments describing parameters to use with algorithm (i.e., x, y, training\_frame). Look at the specific algorithm - h2o.gbm, h2o.glm, h2o.kmeans, h2o.deepLearning - for available parameters.

hyper\_params List of lists of hyper parameters (i.e.,  $list(ntrees=c(1,2),max\_depth=c(5,7))$ ).

(Optional) If specified then override the default heuristic which decides if the is\_supervised given algorithm name and parameters specify a supervised or unsupervised al-

gorithm.

do\_hyper\_params\_check

Perform client check for specified hyper parameters. It can be time expensive for large hyper space.

search\_criteria

(Optional) List of control parameters for smarter hyperparameter search. The list can include values for: strategy, max\_models, max\_runtime\_secs, stopping\_metric, stopping\_tolerance, stopping\_rounds and seed. The default strategy 'Cartesian' covers the entire space of hyperparameter combinations. If you want to use cartesian grid search, you can leave the search criteria argument unspecified. Specify the "RandomDiscrete" strategy to get random search of all the combinations of your hyperparameters with three ways of specifying when to stop the search: max number of models, max time, and metric-based early stopping (e.g., stop if MSE has not improved by 0.0001 over the 5 best models). Examples below: list(strategy = "RandomDiscrete", max\_runtime\_secs = 600, max\_models

= 100, stopping\_metric = "AUTO", stopping\_tolerance = 0.00001, stopping\_rounds = 5, seed = 123456) or list(strategy = "RandomDiscrete", max\_models = 42, max\_runtime\_secs = 28800) or list(strategy = "RandomDiscrete", stopping\_metric = "AUTO", stopping\_tolerance

= 0.001, stopping\_rounds = 10) or list(strategy = "RandomDiscrete", stopping\_metric = "misclassification", stopping\_tolerance = 0.00001, stopping\_rounds

= 5).

148 h2o.group\_by

```
export_checkpoints_dir
```

Directory to automatically export grid in binary form to.

parallelism

Level of Parallelism during grid model building. 1 = sequential building (default). Use the value of 0 for adaptive parallelism - decided by H2O. Any number > 1 sets the exact number of models built in parallel.

## **Details**

Launch grid search with given algorithm and parameters.

## **Examples**

h2o.group\_by

Group and Apply by Column

## **Description**

Performs a group by and apply similar to ddply.

# Usage

```
h2o.group_by(
  data,
  by,
  ...,
  gb.control = list(na.methods = NULL, col.names = NULL)
)
```

# **Arguments**

```
data an H2OFrame object.

by a list of column names

... any supported aggregate function. See Details: for more help.
```

h2o.group\_by 149

gb.control

a list of how to handle NA values in the dataset as well as how to name output columns. The method is specified using the rm.method argument. See Details: for more help.

### **Details**

In the case of na.methods within gb.control, there are three possible settings. "all" will include NAs in computation of functions. "rm" will completely remove all NA fields. "ignore" will remove NAs from the numerator but keep the rows for computational purposes. If a list smaller than the number of columns groups is supplied, the list will be padded by "ignore".

Note that to specify a list of column names in the gb.control list, you must add the col.names argument. Similar to na.methods, col.names will pad the list with the default column names if the length is less than the number of colums groups supplied.

Supported functions include nrow. This function is required and accepts a string for the name of the generated column. Other supported aggregate functions accept col and na arguments for specifying columns and the handling of NAs ("all", "ignore", and GroupBy object; max calculates the maximum of each column specified in col for each group of a GroupBy object; mean calculates the mean of each column specified in col for each group of a GroupBy object; min calculates the minimum of each column specified in col for each group of a GroupBy object; so calculates the mode of each column specified in col for each group of a GroupBy object; ss calculates the sum of squares of each column specified in col for each group of a GroupBy object; sum calculates the sum of each column specified in col for each group of a GroupBy object; and var calculates the variance of each column specified in col for each group of a GroupBy object. If an aggregate is provided without a value (for example, as max in sum(col="X1",na="all").mean(col="X5",na="all").max()), then it is assumed that the aggregation should apply to all columns except the GroupBy columns. However, operations will not be performed on String columns. They will be skipped. Note again that nrow is required and cannot be empty.

### Value

Returns a new H2OFrame object with columns equivalent to the number of groups created

```
## Not run:
library(h2o)
h2o.init()
df <- h2o.importFile("http://s3.amazonaws.com/h2o-public-test-data/smalldata/prostate/prostate.csv")
h2o.group_by(data = df, by = "RACE", nrow("VOL"))
## End(Not run)</pre>
```

150 h2o.head

h2o.gsub

String Global Substitute

## **Description**

Creates a copy of the target column in which each string has all occurence of the regex pattern replaced with the replacement substring.

### Usage

```
h2o.gsub(pattern, replacement, x, ignore.case = FALSE)
```

## Arguments

pattern The pattern to replace.
replacement The replacement pattern.

x The column on which to operate.

ignore.case Case sensitive or not

# **Examples**

```
## Not run:
library(h2o)
h2o.init()
string_to_gsub <- as.h2o("r tutorial")
sub_string <- h2o.gsub("r ", "H2O ", string_to_gsub)
## End(Not run)</pre>
```

h2o.head

Return the Head or Tail of an H2O Dataset.

# Description

Returns the first or last rows of an H2OFrame object.

```
h2o.head(x, n = 6L, m = 200L, ...)
## S3 method for class 'H2OFrame'
head(x, n = 6L, m = 200L, ...)
h2o.tail(x, n = 6L, m = 200L, ...)
## S3 method for class 'H2OFrame'
tail(x, n = 6L, m = 200L, ...)
```

h2o.HGLMMetrics 151

## **Arguments**

X	An H2OFrame object.
n	(Optional) A single integer. If positive, number of rows in x to return. If negative, all but the n first/last number of rows in x.
m	(Optional) A single integer. If positive, number of columns in $x$ to return. If negative, all but the m first/last number of columns in $x$ .
	Ignored.

## Value

An H2OFrame containing the first or last n rows and m columns of an H2OFrame object.

# **Examples**

```
## Not run:
library(h2o)
h2o.init(ip <- "localhost", port = 54321, startH2O = TRUE)
australia_path <- system.file("extdata", "australia.csv", package = "h2o")
australia <- h2o.uploadFile(path = australia_path)
# Return the first 10 rows and 6 columns
h2o.head(australia, n = 10L, m = 6L)
# Return the last 10 rows and 6 columns
h2o.tail(australia, n = 10L, m = 6L)

# For Jupyter notebook with an R kernel,
# view all rows of a data frame
options(repr.matrix.max.rows=600, repr.matrix.max.cols=200)

## End(Not run)</pre>
```

h2o.HGLMMetrics

Retrieve HGLM ModelMetrics

## **Description**

Retrieve HGLM ModelMetrics

# Usage

```
h2o.HGLMMetrics(object)
```

## **Arguments**

object

an H2OModel object or H2OModelMetrics.

h2o.hit\_ratio\_table

h2o.hist

Compute A Histogram

### **Description**

Compute a histogram over a numeric column. If breaks=="FD", the MAD is used over the IQR in computing bin width. Note that we do not beautify the breakpoints as R does.

## Usage

```
h2o.hist(x, breaks = "Sturges", plot = TRUE)
```

## **Arguments**

x A single numeric column from an H2OFrame.

breaks Can be one of the following: A string: "Sturges", "Rice", "sqrt", "Doane", "FD",

"Scott" A single number for the number of breaks splitting the range of the vec into number of breaks bins of equal width A vector of numbers giving the split

points, e.g., c(-50,213.2123,9324834)

plot A logical value indicating whether or not a plot should be generated (default is

TRUE).

### **Examples**

```
## Not run:
library(h2o)
h2o.init()

f <- "http://h2o-public-test-data.s3.amazonaws.com/smalldata/iris/iris_train.csv"
iris <- h2o.importFile(f)
h2o.asnumeric(iris["petal_len"])
h2o.hist(iris["petal_len"], breaks = "Sturges", plot = TRUE)

## End(Not run)</pre>
```

h2o.hit\_ratio\_table

Retrieve the Hit Ratios

# Description

If "train", "valid", and "xval" parameters are FALSE (default), then the training Hit Ratios value is returned. If more than one parameter is set to TRUE, then a named list of Hit Ratio tables are returned, where the names are "train", "valid" or "xval".

```
h2o.hit_ratio_table(object, train = FALSE, valid = FALSE, xval = FALSE)
```

h2o.hour 153

## **Arguments**

object An H2OModel object.

train Retrieve the training Hit Ratio

valid Retrieve the validation Hit Ratio

xval Retrieve the cross-validation Hit Ratio

## **Examples**

```
## Not run:
library(h2o)
h2o.init()

f <- "https://s3.amazonaws.com/h2o-public-test-data/smalldata/iris/iris_wheader.csv"
iris <- h2o.importFile(f)
iris.split <- h2o.splitFrame(data = iris, ratios = 0.8, seed = 1234)
train <- iris.split[[1]]
valid <- iris.split[[2]]

iris_xgb <- h2o.xgboost(x = 1:4, y = 5, training_frame = train, validation_frame = valid)
hrt_iris <- h2o.hit_ratio_table(iris_xgb, valid = TRUE)
hrt_iris

## End(Not run)</pre>
```

h2o.hour

Convert Milliseconds to Hour of Day in H2O Datasets

## **Description**

Converts the entries of an H2OFrame object from milliseconds to hours of the day (on a 0 to 23 scale).

### Usage

```
h2o.hour(x)
hour(x)
## S3 method for class 'H20Frame'
hour(x)
```

### **Arguments**

Χ

An H2OFrame object.

## Value

An H2OFrame object containing the entries of x converted to hours of the day.

h2o.ifelse

## See Also

```
h2o.day
```

h2o.ifelse

H2O Apply Conditional Statement

## **Description**

Applies conditional statements to numeric vectors in H2O parsed data objects when the data are numeric.

## Usage

```
h2o.ifelse(test, yes, no)
ifelse(test, yes, no)
```

# Arguments

test A logical description of the condition to be met (>, <, =, etc...)

yes The value to return if the condition is TRUE.

no The value to return if the condition is FALSE.

### **Details**

Both numeric and categorical values can be tested. However when returning a yes and no condition both conditions must be either both categorical or numeric.

# Value

Returns a vector of new values matching the conditions stated in the ifelse call.

```
## Not run:
library(h2o)
h2o.init()
australia_path <- system.file("extdata", "australia.csv", package = "h2o")
australia <- h2o.importFile(path = australia_path)
australia[,9] <- ifelse(australia[,3] < 279.9, 1, 0)
summary(australia)
## End(Not run)</pre>
```

h2o.importFile 155

h2o.importFile

Import Files into H2O

## **Description**

Imports files into an H2O cluster. The default behavior is to pass-through to the parse phase automatically.

```
h2o.importFile(
  path,
  destination_frame = "",
  parse = TRUE,
  header = NA,
  sep = "",
  col.names = NULL,
  col.types = NULL,
  na.strings = NULL,
  decrypt_tool = NULL,
  skipped_columns = NULL,
  custom_non_data_line_markers = NULL
)
h2o.importFolder(
  path,
  pattern = "",
  destination_frame = "",
  parse = TRUE,
  header = NA,
  sep = "",
  col.names = NULL,
  col.types = NULL,
  na.strings = NULL,
  decrypt_tool = NULL,
  skipped_columns = NULL,
  custom_non_data_line_markers = NULL
)
h2o.importHDFS(
  path,
  pattern = "",
  destination_frame = "",
  parse = TRUE,
  header = NA,
  sep = "",
  col.names = NULL,
```

156 h2o.importFile

```
na.strings = NULL
)
h2o.uploadFile(
  path,
  destination_frame = "",
  parse = TRUE,
  header = NA,
  sep = "",
  col.names = NULL,
  col.types = NULL,
  na.strings = NULL,
  progressBar = FALSE,
  parse_type = NULL,
  decrypt_tool = NULL,
  skipped\_columns = NULL
)
```

### **Arguments**

path The complete URL or normalized file path of the file to be imported. Each row

of data appears as one line of the file.

destination\_frame

(Optional) The unique hex key assigned to the imported file. If none is given, a

key will automatically be generated based on the URL path.

parse (Optional) A logical value indicating whether the file should be parsed after

import, for details see h2o.parseRaw.

header (Optional) A logical value indicating whether the first line of the file contains

column headers. If left empty, the parser will try to automatically detect this.

sep (Optional) The field separator character. Values on each line of the file are sep-

arated by this character. If sep = "", the parser will automatically detect the

separator.

col.names (Optional) An H2OFrame object containing a single delimited line with the col-

umn names for the file.

col.types (Optional) A vector to specify whether columns should be forced to a certain

type upon import parsing.

na. strings (Optional) H2O will interpret these strings as missing.

decrypt\_tool (Optional) Specify a Decryption Tool (key-reference acquired by calling h2o.decryptionSetup.

skipped\_columns

a list of column indices to be skipped during parsing.

custom\_non\_data\_line\_markers

(Optional) If a line in imported file starts with any character in given string it will NOT be imported. Empty string means all lines are imported, NULL means

that default behaviour for given format will be used

pattern (Optional) Character string containing a regular expression to match file(s) in

the folder.

progressBar	(Optional) When FALSE, tell H2O parse call to block synchronously instead of polling. This can be faster for small datasets but loses the progress bar.
parse_type	(Optional) Specify which parser type H2O will use. Valid types are "ARFF", "XLS", "CSV", "SVMLight"

### **Details**

h2o.importFile is a parallelized reader and pulls information from the server from a location specified by the client. The path is a server-side path. This is a fast, scalable, highly optimized way to read data. H2O pulls the data from a data store and initiates the data transfer as a read operation.

Unlike the import function, which is a parallelized reader, h2o.uploadFile is a push from the client to the server. The specified path must be a client-side path. This is not scalable and is only intended for smaller data sizes. The client pushes the data from a local filesystem (for example, on your machine where R is running) to H2O. For big-data operations, you don't want the data stored on or flowing through the client.

h2o.importFolder imports an entire directory of files. If the given path is relative, then it will be relative to the start location of the H2O instance. The default behavior is to pass-through to the parse phase automatically.

h2o.importHDFS is deprecated. Instead, use h2o.importFile.

```
## Not run:
h2o.init(ip = "localhost", port = 54321, startH20 = TRUE)
prostate_path = system.file("extdata", "prostate.csv", package = "h2o")
prostate = h2o.importFile(path = prostate_path)
class(prostate)
summary(prostate)

#Import files with a certain regex pattern by utilizing h2o.importFolder()
#In this example we import all .csv files in the directory prostate_folder
prostate_path = system.file("extdata", "prostate_folder", package = "h2o")
prostate_pattern = h2o.importFolder(path = prostate_path, pattern = ".*.csv")
class(prostate_pattern)
summary(prostate_pattern)

## End(Not run)
```

158 h2o.import\_mojo

## **Description**

Import Hive table to H2OFrame in memory. Make sure to start H2O with Hive on classpath. Uses hive-site.xml on classpath to connect to Hive. When database is specified as jdbc URL uses Hive JDBC driver to obtain table metadata. then uses direct HDFS access to import data.

### Usage

```
h2o.import_hive_table(
  database,
  table,
  partitions = NULL,
  allow_multi_format = FALSE
)
```

### **Arguments**

database Name of Hive database (default database will be used by default), can be also a

JDBC URL

table name of Hive table to import

partitions a list of lists of strings - partition key column values of partitions you want to

import.

allow\_multi\_format

enable import of partitioned tables with different storage formats used. WARN-ING: this may fail on out-of-memory for tables with a large number of small

partitions.

# **Details**

For example, my\_citibike\_data =  $h2o.import_hive_table("default", "citibike20k", partitions = list(c("2017", "01"), c("2017", "02")))$  my\_citibike\_data =  $h2o.import_hive_table("jdbc:hive2://hive-server:10000/default", "citibike20k", allow_multi_format = TRUE)$ 

h2o.import\_mojo

Imports a MOJO under given path, creating a Generic model with it.

## **Description**

Usage example: mojo\_model <- h2o.import\_mojo(model\_file\_path = "/path/to/mojo.zip") predictions <- h2o.predict(mojo\_model, dataset)

## Usage

```
h2o.import_mojo(mojo_file_path)
```

### **Arguments**

mojo\_file\_path Filesystem path to the model imported

h2o.import\_sql\_select 159

### Value

Returns H2O Generic Model embedding given MOJO model

### **Examples**

```
## Not run:
# Import default Iris dataset as H2O frame
data <- as.h2o(iris)

# Train a very simple GBM model
features <- c("Sepal.Length", "Sepal.Length", "Sepal.Width", "Petal.Length", "Petal.Width")
original_model <- h2o.gbm(x=features, y = "Species", training_frame = data)

# Download the trained GBM model as MOJO (temporary directory used in this example)
mojo_original_name <- h2o.download_mojo(model = original_model, path = tempdir())
mojo_original_path <- paste0(tempdir(),"/",mojo_original_name)

# Import the MOJO and obtain a Generic model
mojo_model <- h2o.import_mojo(mojo_original_path)

# Perform scoring with the generic model
predictions <- h2o.predict(mojo_model, data)

## End(Not run)</pre>
```

### **Description**

Creates a temporary SQL table from the specified sql\_query. Runs multiple SELECT SQL queries on the temporary table concurrently for parallel ingestion, then drops the table. Be sure to start the h2o.jar in the terminal with your downloaded JDBC driver in the classpath: 'java-cp <path\_to\_h2o\_jar>:<path\_to\_jdbc\_driver water.H2OApp' Also see h2o.import\_sql\_table. Currently supported SQL databases are MySQL, PostgreSQL, MariaDB, Hive, Oracle and Microsoft SQL Server.

```
h2o.import_sql_select(
  connection_url,
  select_query,
  username,
  password,
  use_temp_table = NULL,
  temp_table_name = NULL,
  optimize = NULL,
  fetch_mode = NULL
)
```

### **Arguments**

connection\_url URL of the SQL database connection as specified by the Java Database Connec-

tivity (JDBC) Driver. For example, "jdbc:mysql://localhost:3306/menagerie?&useSSL=false"

select\_query SQL query starting with 'SELECT' that returns rows from one or more database

tables.

username Username for SQL server password Password for SQL server

use\_temp\_table Whether a temporary table should be created from select\_query

temp\_table\_name

Name of temporary table to be created from select\_query

optimize (Optional) Optimize import of SQL table for faster imports. Experimental. De-

fault is true.

fetch\_mode (Optional) Set to DISTRIBUTED to enable distributed import. Set to SINGLE

to force a sequential read from the database Can be used for databases that do

not support OFFSET-like clauses in SQL statements.

#### **Details**

For example, my\_sql\_conn\_url <- "jdbc:mysql://172.16.2.178:3306/ingestSQL?&useSSL=false" select\_query <- "SELECT bikeid from citibike20k" username <- "root" password <- "abc123" my\_citibike\_data <- h2o.import\_sql\_select(my\_sql\_conn\_url, select\_query, username, password)

### **Description**

Imports SQL table into an H2O cluster. Assumes that the SQL table is not being updated and is stable. Runs multiple SELECT SQL queries concurrently for parallel ingestion. Be sure to start the h2o.jar in the terminal with your downloaded JDBC driver in the classpath: 'java -cp <path\_to\_h2o\_jar>:<path\_to\_jdbc\_driver\_jar> water.H2OApp' Also see h2o.import\_sql\_select. Currently supported SQL databases are MySQL, PostgreSQL, MariaDB, Hive, Oracle and Microsoft SQL Server.

```
h2o.import_sql_table(
  connection_url,
  table,
  username,
  password,
  columns = NULL,
  optimize = NULL,
  fetch_mode = NULL
)
```

h2o.impute

### **Arguments**

connection\_url URL of the SQL database connection as specified by the Java Database Connec-

tivity (JDBC) Driver. For example, "jdbc:mysql://localhost:3306/menagerie?&useSSL=false"

table Name of SQL table

username Username for SQL server

password Password for SQL server

columns (Optional) Character vector of column names to import from SQL table. Default

is to import all columns.

optimize (Optional) Optimize import of SQL table for faster imports. Default is true.

Ignored - use fetch\_mode instead.

fetch\_mode (Optional) Set to DISTRIBUTED to enable distributed import. Set to SINGLE

to force a sequential read from the database Can be used for databases that do

not support OFFSET-like clauses in SQL statements.

### **Details**

For example, my\_sql\_conn\_url <- "jdbc:mysql://172.16.2.178:3306/ingestSQL?&useSSL=false" table <- "citibike20k" username <- "root" password <- "abc123" my\_citibike\_data <- h2o.import\_sql\_table(my\_sql\_conn\_url table, username, password)

h2o.impute

Basic Imputation of H2O Vectors

### **Description**

Perform inplace imputation by filling missing values with aggregates computed on the "na.rm'd" vector. Additionally, it's possible to perform imputation based on groupings of columns from within data; these columns can be passed by index or name to the by parameter. If a factor column is supplied, then the method must be "mode".

```
h2o.impute(
  data,
  column = 0,
  method = c("mean", "median", "mode"),
  combine_method = c("interpolate", "average", "lo", "hi"),
  by = NULL,
  groupByFrame = NULL,
  values = NULL
)
```

### **Arguments**

data The dataset containing the column to impute.

column A specific column to impute, default of 0 means impute the whole frame.

method "mean" replaces NAs with the column mean; "median" replaces NAs with the

column median; "mode" replaces with the most common factor (for factor columns

only);

combine\_method If method is "median", then choose how to combine quantiles on even sample

sizes. This parameter is ignored in all other cases.

by group by columns

groupByFrame Impute the column col with this pre-computed grouped frame.

values A vector of impute values (one per column). NaN indicates to skip the column

### **Details**

The default method is selected based on the type of the column to impute. If the column is numeric then "mean" is selected; if it is categorical, then "mode" is selected. Other column types (e.g. String, Time, UUID) are not supported.

### Value

an H2OFrame with imputed values

## **Examples**

```
## Not run:
h2o.init()
iris_hf <- as.h2o(iris)
iris_hf[sample(nrow(iris_hf), 40), 5] <- NA # randomly replace 50 values with NA
# impute with a group by
iris_hf <- h2o.impute(iris_hf, "Species", "mode", by = c("Sepal.Length", "Sepal.Width"))
## End(Not run)</pre>
```

h2o.init

Initialize and Connect to H2O

## **Description**

Attempts to start and/or connect to and H2O instance.

## Usage

```
h2o.init(
  ip = "localhost",
  port = 54321,
  name = NA_character_,
  startH20 = TRUE,
  forceDL = FALSE,
  enable_assertions = TRUE,
  license = NULL,
  nthreads = -1,
  max_mem_size = NULL,
 min_mem_size = NULL,
  ice_root = tempdir(),
  log_dir = NA_character_,
  log_level = NA_character_,
  strict_version_check = TRUE,
  proxy = NA_character_,
  https = FALSE,
  cacert = NA_character_,
  insecure = FALSE,
  username = NA_character_,
  password = NA_character_,
  use_spnego = FALSE,
  cookies = NA_character_,
  context_path = NA_character_,
  ignore_config = FALSE,
  extra_classpath = NULL,
  jvm_custom_args = NULL,
  bind_to_localhost = TRUE
)
```

### **Arguments**

Object of class character representing the IP address of the server where H2O ip

is running.

port Object of class numeric representing the port number of the H2O server.

(Optional) A character string representing the H2O cluster name. name

startH20 (Optional) A logical value indicating whether to try to start H2O from R if no

connection with H2O is detected. This is only possible if ip = "localhost" or

ip = "127.0.0.1". If an existing connection is detected, R does not start H2O.

forceDL (Optional) A logical value indicating whether to force download of the H2O

> executable. Defaults to FALSE, so the executable will only be downloaded if it does not already exist in the h2o R library resources directory h2o/java/h2o.jar.

This value is only used when R starts H2O.

enable\_assertions

(Optional) A logical value indicating whether H2O should be launched with assertions enabled. Used mainly for error checking and debugging purposes.

This value is only used when R starts H2O.

license (Optional) A character string value specifying the full path of the license file.

This value is only used when R starts H2O.

nthreads (Optional) Number of threads in the thread pool. This relates very closely to the

number of CPUs used. -1 means use all CPUs on the host (Default). A positive integer specifies the number of CPUs directly. This value is only used when R

starts H2O.

max\_mem\_size (Optional) A character string specifying the maximum size, in bytes, of the

memory allocation pool to H2O. This value must a multiple of 1024 greater than 2MB. Append the letter m or M to indicate megabytes, or g or G to indicate

gigabytes. This value is only used when R starts H2O.

min\_mem\_size (Optional) A character string specifying the minimum size, in bytes, of the

memory allocation pool to H2O. This value must a multiple of 1024 greater than 2MB. Append the letter m or M to indicate megabytes, or g or G to indicate

gigabytes. This value is only used when R starts H2O.

ice\_root (Optional) A directory to handle object spillage. The defaul varies by OS.

log\_dir (Optional) A directory where H2O server logs are stored. The default varies by

OS.

log\_level (Optional) The level of logging of H2O server. The default is INFO.

strict\_version\_check

(Optional) Setting this to FALSE is unsupported and should only be done when

advised by technical support.

proxy (Optional) A character string specifying the proxy path.

https (Optional) Set this to TRUE to use https instead of http.

cacert (Optional) Path to a CA bundle file with root and intermediate certificates of

trusted CAs.

insecure (Optional) Set this to TRUE to disable SSL certificate checking.

username (Optional) Username to login with.
password (Optional) Password to login with.

use\_spnego (Optional) Set this to TRUE to enable SPNEGO authentication.

cookies (Optional) Vector(or list) of cookies to add to request.

context\_path (Optional) The last part of connection URL: http://<ip>:<port>/<context\_path>

ignore\_config (Optional) A logical value indicating whether a search for a .h2oconfig file

should be conducted or not. Default value is FALSE.

extra\_classpath

(Optional) A vector of paths to libraries to be added to the Java classpath when

H2O is started from R.

jvm\_custom\_args

(Optional) A character list of custom arguments for the JVM where new H2O instance is going to run, if started. Ignored when connecting to an existing

instance.

bind\_to\_localhost

(Optional) A logical flag indicating whether access to the H2O instance should be restricted to the local machine (default) or if it can be reached from other computers on the network. Only applicable when H2O is started from R.

### **Details**

By default, this method first checks if an H2O instance is connectible. If it cannot connect and start = TRUE with ip = "localhost", it will attempt to start and instance of H2O at localhost:54321. If an open ip and port of your choice are passed in, then this method will attempt to start an H2O instance at that specified ip port.

When initializing H2O locally, this method searches for h2o.jar in the R library resources (system.file("java", "h2o.jar" = "h2o")), and if the file does not exist, it will automatically attempt to download the correct version from Amazon S3. The user must have Internet access for this process to be successful.

Once connected, the method checks to see if the local H2O R package version matches the version of H2O running on the server. If there is a mismatch and the user indicates she wishes to upgrade, it will remove the local H2O R package and download/install the H2O R package from the server.

#### Value

this method will load it and return a H20Connection object containing the IP address and port number of the H2O server.

### Note

Users may wish to manually upgrade their package (rather than waiting until being prompted), which requires that they fully uninstall and reinstall the H2O package, and the H2O client package. You must unload packages running in the environment before upgrading. It's recommended that users restart R or R studio after upgrading

# See Also

H2O R package documentation for more details. h2o. shutdown for shutting down from R.

```
## Not run:
# Try to connect to a local H2O instance that is already running.
# If not found, start a local H2O instance from R with the default settings.
h2o.init()

# Try to connect to a local H2O instance.
# If not found, raise an error.
h2o.init(startH2O = FALSE)

# Try to connect to a local H2O instance that is already running.
# If not found, start a local H2O instance from R with 5 gigabytes of memory.
h2o.init(max_mem_size = "5g")

# Try to connect to a local H2O instance that is already running.
# If not found, start a local H2O instance from R that uses 5 gigabytes of memory.
h2o.init(max_mem_size = "5g")

## End(Not run)
```

h2o.insertMissingValues

Insert Missing Values into an H2OFrame

# Description

Randomly replaces a user-specified fraction of entries in an H2O dataset with missing values.

# Usage

```
h2o.insertMissingValues(data, fraction = 0.1, seed = -1)
```

### **Arguments**

data An H2OFrame object representing the dataset.

fraction A number between 0 and 1 indicating the fraction of entries to replace with

missing.

seed A random number used to select which entries to replace with missing values.

Default of seed = -1 will automatically generate a seed in H2O.

## Value

Returns an H2OFrame object.

# WARNING

This will modify the original dataset. Unless this is intended, this function should only be called on a subset of the original.

```
## Not run:
library(h2o)
h2o.init()
iris_hf <- as.h2o(iris)
summary(iris_hf)

irismiss <- h2o.insertMissingValues(iris_hf, fraction = 0.25)
head(irismiss)
summary(irismiss)
## End(Not run)</pre>
```

h2o.interaction

h2o.	٦r	iter	act	1 On

Categorical Interaction Feature Creation in H2O

## **Description**

Creates a data frame in H2O with n-th order interaction features between categorical columns, as specified by the user.

# Usage

```
h2o.interaction(
  data,
  destination_frame,
  factors,
  pairwise,
  max_factors,
  min_occurrence
)
```

# **Arguments**

data An H2OFrame object containing the categorical columns.

destination\_frame

A string indicating the destination key. If empty, this will be auto-generated by

H2O

factors Factor columns (either indices or column names).

pairwise Whether to create pairwise interactions between factors (otherwise create one

higher-order interaction). Only applicable if there are 3 or more factors.

max\_factors Max. number of factor levels in pair-wise interaction terms (if enforced, one

extra catch-all factor will be made)

min\_occurrence Min. occurrence threshold for factor levels in pair-wise interaction terms

### Value

Returns an H2OFrame object.

168 h2o.isax

```
binary_fraction = 0, binary_ones_fraction = 0.5,
                            missing_fraction = 0.2,
                            response_factors = 1)
# Turn integer column into a categorical
myframe[,5] <- as.factor(myframe[,5])</pre>
head(myframe, 20)
# Create pairwise interactions
pairwise <- h2o.interaction(myframe,</pre>
                             factors = list(c(1, 2), c("C2", "C3", "C4")),
                             pairwise = TRUE, max_factors = 10, min_occurrence = 1)
head(pairwise, 20)
h2o.levels(pairwise, 2)
# Create 5-th order interaction
higherorder \leftarrow h2o.interaction(myframe, destination_frame = 'higherorder', factors = c(1,2,3,4,5),
                               pairwise = FALSE, max_factors = 10000, min_occurrence = 1)
head(higherorder, 20)
# Limit the number of factors of the "categoricalized" integer column
# to at most 3 factors, and only if they occur at least twice
head(myframe[,5], 20)
trim_integer_levels <- h2o.interaction(myframe, factors = "C5", pairwise = FALSE, max_factors = 3,
                                        min_occurrence = 2)
head(trim_integer_levels, 20)
# Put all together
myframe <- h2o.cbind(myframe, pairwise, higherorder, trim_integer_levels)</pre>
myframe
head(myframe, 20)
summary(myframe)
## End(Not run)
```

### **Description**

h2o.isax

Compute the iSAX index for a DataFrame which is assumed to be numeric time series data

### Usage

```
h2o.isax(x, num_words, max_cardinality, optimize_card = FALSE)
```

iSAX

### Arguments

x an H2OFrame

num\_words Number of iSAX words for the timeseries. ie granularity along the time series

h2o.ischaracter 169

```
max_cardinality
```

Maximum cardinality of the iSAX word. Each word can have less than the max

optimize\_card

An optimization flag that will find the max cardinality regardless of what is passed in for max\_cardinality.

### Value

An H2OFrame with the name of time series, string representation of iSAX word, followed by binary representation

### References

```
http://www.cs.ucr.edu/~eamonn/iSAX_2.0.pdf
http://www.cs.ucr.edu/~eamonn/SAX.pdf
```

## **Examples**

h2o.ischaracter

Check if character

### **Description**

Check if character

## Usage

```
h2o.ischaracter(x)
```

### **Arguments**

Х

An H2OFrame object.

### See Also

is.character for the base R implementation.

h2o.isfactor

## **Examples**

```
## Not run:
library(h2o)
h2o.init()

f <- "https://s3.amazonaws.com/h2o-public-test-data/smalldata/iris/iris_wheader.csv"
iris <- h2o.importFile(f)
iris_char <- h2o.ascharacter(iris["class"])
h2o.ischaracter(iris_char)

## End(Not run)</pre>
```

h2o.isfactor

Check if factor

# **Description**

Check if factor

## Usage

```
h2o.isfactor(x)
```

# Arguments

Χ

An H2OFrame object.

### See Also

is. factor for the base R implementation.

```
## Not run:
library(h2o)
h2o.init()

f <- "https://s3.amazonaws.com/h2o-public-test-data/smalldata/junit/cars_20mpg.csv"
cars <- h2o.importFile(f)
cars["economy_20mpg"] <- as.factor(cars["economy_20mpg"])
h2o.isfactor(cars["economy_20mpg"])
## End(Not run)</pre>
```

h2o.isnumeric 171

h2o.isnumeric

Check if numeric

## **Description**

Check if numeric

## Usage

```
h2o.isnumeric(x)
```

## **Arguments**

Х

An H2OFrame object.

### See Also

is.numeric for the base R implementation.

# **Examples**

```
## Not run:
library(h2o)
h2o.init()

f <- "https://s3.amazonaws.com/h2o-public-test-data/smalldata/iris/iris_wheader.csv"
iris <- h2o.importFile(f)
h2o.isnumeric(iris["sepal_len"])
## End(Not run)</pre>
```

h2o.isolationForest

Trains an Isolation Forest model

# Description

Trains an Isolation Forest model

```
h2o.isolationForest(
  training_frame,
  x,
  model_id = NULL,
  score_each_iteration = FALSE,
  score_tree_interval = 0,
  ignore_const_cols = TRUE,
```

172 h2o.isolationForest

```
ntrees = 50,
     max_depth = 8,
     min_rows = 1,
     max_runtime_secs = 0,
      seed = -1,
      build_tree_one_node = FALSE,
     mtries = -1,
      sample_size = 256,
      sample_rate = -1,
      col_sample_rate_change_per_level = 1,
      col_sample_rate_per_tree = 1,
     categorical_encoding = c("AUTO", "Enum", "OneHotInternal", "OneHotExplicit", "Binary",
        "Eigen", "LabelEncoder", "SortByResponse", "EnumLimited"),
      stopping_rounds = 0,
      stopping_metric = c("AUTO", "anomaly_score"),
      stopping_tolerance = 0.01,
      export_checkpoints_dir = NULL
    )
Arguments
    training_frame Id of the training data frame.
                    A vector containing the character names of the predictors in the model.
   model_id
                    Destination id for this model; auto-generated if not specified.
    score_each_iteration
                    Logical. Whether to score during each iteration of model training. Defaults to
                    FALSE.
    score_tree_interval
                     Score the model after every so many trees. Disabled if set to 0. Defaults to 0.
```

ignore\_const\_cols

Logical. Ignore constant columns. Defaults to TRUE.

ntrees Number of trees. Defaults to 50.

Maximum tree depth. Defaults to 8. max\_depth

Fewest allowed (weighted) observations in a leaf. Defaults to 1. min\_rows

max\_runtime\_secs

Maximum allowed runtime in seconds for model training. Use 0 to disable.

Defaults to 0.

seed Seed for random numbers (affects certain parts of the algo that are stochastic

and those might or might not be enabled by default). Defaults to -1 (time-based

random number).

build\_tree\_one\_node

Logical. Run on one node only; no network overhead but fewer cpus used. Suitable for small datasets. Defaults to FALSE.

mtries Number of variables randomly sampled as candidates at each split. If set to -1, defaults (number of predictors)/3. Defaults to -1.

h2o.isolationForest 173

sample\_size Number of randomly sampled observations used to train each Isolation Forest

tree. Only one of parameters sample\_size and sample\_rate should be defined. If

sample\_rate is defined, sample\_size will be ignored. Defaults to 256.

sample\_rate Rate of randomly sampled observations used to train each Isolation Forest tree. Needs to be in range from 0.0 to 1.0. If set to -1, sample\_rate is disabled and

sample\_size will be used instead. Defaults to -1.

col\_sample\_rate\_change\_per\_level

Relative change of the column sampling rate for every level (must be > 0.0 and <= 2.0) Defaults to 1.

col\_sample\_rate\_per\_tree

Column sample rate per tree (from 0.0 to 1.0) Defaults to 1.

categorical\_encoding

Encoding scheme for categorical features Must be one of: "AUTO", "Enum", "OneHotInternal", "OneHotExplicit", "Binary", "Eigen", "LabelEncoder", "Sort-ByResponse", "EnumLimited". Defaults to AUTO.

stopping\_rounds

Early stopping based on convergence of stopping\_metric. Stop if simple moving average of length k of the stopping\_metric does not improve for k:=stopping\_rounds scoring events (0 to disable) Defaults to 0.

stopping\_metric

Metric to use for early stopping (AUTO: logloss for classification, deviance for regression and anonomaly\_score for Isolation Forest). Note that custom and custom\_increasing can only be used in GBM and DRF with the Python client. Must be one of: "AUTO", "anomaly\_score". Defaults to AUTO.

stopping\_tolerance

Relative tolerance for metric-based stopping criterion (stop if relative improvement is not at least this much) Defaults to 0.01.

export\_checkpoints\_dir

Automatically export generated models to this directory.

h2o.keyof

h2o.is\_client

Check Client Mode Connection

## **Description**

Check Client Mode Connection

## Usage

```
h2o.is_client()
```

h2o.keyof

Method on Keyed objects allowing to obtain their key.

## **Description**

Method on Keyed objects allowing to obtain their key.

# Usage

```
h2o.keyof(object)

## S4 method for signature 'Keyed'
h2o.keyof(object)

## S4 method for signature 'H2OModel'
h2o.keyof(object)

## S4 method for signature 'H2OGrid'
h2o.keyof(object)

## S4 method for signature 'H2OFrame'
h2o.keyof(object)

## S4 method for signature 'H2OAutoML'
h2o.keyof(object)
```

# Arguments

object

A Keyed object

### Value

the string key holding the persistent object.

h2o.kfold\_column 175

h2o.kfold_column	Produce a k-fold column vector.	
	v	

## **Description**

Create a k-fold vector useful for H2O algorithms that take a fold\_assignments argument.

## Usage

```
h2o.kfold_column(data, nfolds, seed = -1)
```

### **Arguments**

data A dataframe against which to create the fold column.

nfolds The number of desired folds.

seed A random seed, -1 indicates that H2O will choose one.

### Value

Returns an H2OFrame object with fold assignments.

### **Examples**

```
## Not run:
library(h2o)
h2o.init()

f <- "https://s3.amazonaws.com/h2o-public-test-data/smalldata/iris/iris_wheader.csv"
iris <- h2o.importFile(f)
kfolds <- h2o.kfold_column(iris, nfolds = 5, seed = 1234)
## End(Not run)</pre>
```

h2o.killMinus3

Dump the stack into the JVM's stdout.

# Description

A poor man's profiler, but effective.

```
h2o.killMinus3()
```

176 h2o.kmeans

h2o.kmeans

Performs k-means clustering on an H2O dataset

## Description

Performs k-means clustering on an H2O dataset

## Usage

```
h2o.kmeans(
  training_frame,
  model_id = NULL,
  validation_frame = NULL,
  nfolds = 0,
  keep_cross_validation_models = TRUE,
  keep_cross_validation_predictions = FALSE,
  keep_cross_validation_fold_assignment = FALSE,
  fold_assignment = c("AUTO", "Random", "Modulo", "Stratified"),
  fold_column = NULL,
  ignore_const_cols = TRUE,
  score_each_iteration = FALSE,
  k = 1,
  estimate_k = FALSE,
  user_points = NULL,
  max_iterations = 10,
  standardize = TRUE,
  seed = -1,
  init = c("Random", "PlusPlus", "Furthest", "User"),
  max_runtime_secs = 0,
 categorical_encoding = c("AUTO", "Enum", "OneHotInternal", "OneHotExplicit", "Binary",
    "Eigen", "LabelEncoder", "SortByResponse", "EnumLimited"),
  export_checkpoints_dir = NULL,
  cluster_size_constraints = NULL
)
```

### **Arguments**

```
training_frame Id of the training data frame.

x A vector containing the character names of the predictors in the model.

model_id Destination id for this model; auto-generated if not specified.

validation_frame

Id of the validation data frame.

Number of folds for K-fold cross-validation (0 to disable or >= 2). Defaults to 0.
```

h2o.kmeans 177

keep\_cross\_validation\_models

Logical. Whether to keep the cross-validation models. Defaults to TRUE.

keep\_cross\_validation\_predictions

Logical. Whether to keep the predictions of the cross-validation models. Defaults to FALSE.

keep\_cross\_validation\_fold\_assignment

Logical. Whether to keep the cross-validation fold assignment. Defaults to FALSE.

fold\_assignment

Cross-validation fold assignment scheme, if fold\_column is not specified. The 'Stratified' option will stratify the folds based on the response variable, for classification problems. Must be one of: "AUTO", "Random", "Modulo", "Stratified". Defaults to AUTO.

fold\_column Column with cross-validation fold index assignment per observation.

ignore\_const\_cols

user\_points

Logical. Ignore constant columns. Defaults to TRUE.

score\_each\_iteration

Logical. Whether to score during each iteration of model training. Defaults to FALSE.

k The max. number of clusters. If estimate\_k is disabled, the model will find k centroids, otherwise it will find up to k centroids. Defaults to 1.

estimate\_k Logical. Whether to estimate the number of clusters (<=k) iteratively and deterministically. Defaults to FALSE.

This option allows you to specify a dataframe, where each row represents an initial cluster center. The user- specified points must have the same number of columns as the training observations. The number of rows must equal the number of clusters

max\_iterations Maximum training iterations (if estimate\_k is enabled, then this is for each inner Lloyds iteration) Defaults to 10.

standardize Logical. Standardize columns before computing distances Defaults to TRUE.

Seed for random numbers (affects certain parts of the algo that are stochastic and those might or might not be enabled by default). Defaults to -1 (time-based random number).

init Initialization mode Must be one of: "Random", "PlusPlus", "Furthest", "User". Defaults to Furthest.

max\_runtime\_secs

Maximum allowed runtime in seconds for model training. Use 0 to disable. Defaults to 0.

categorical\_encoding

Encoding scheme for categorical features Must be one of: "AUTO", "Enum", "OneHotInternal", "OneHotExplicit", "Binary", "Eigen", "LabelEncoder", "Sort-ByResponse", "EnumLimited". Defaults to AUTO.

export\_checkpoints\_dir

Automatically export generated models to this directory.

178 h2o.kurtosis

```
cluster_size_constraints
```

An array specifying the minimum number of points that should be in each cluster. The length of the constraints array has to be the same as the number of clusters.

### Value

an object of class H2OClusteringModel.

### See Also

h2o.cluster\_sizes, h2o.totss, h2o.num\_iterations, h2o.betweenss, h2o.tot\_withinss, h2o.withinss, h2o.centersSTD, h2o.centers

## **Examples**

```
## Not run:
library(h2o)
h2o.init()
prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.uploadFile(path = prostate_path)
h2o.kmeans(training_frame = prostate, k = 10, x = c("AGE", "RACE", "VOL", "GLEASON"))
## End(Not run)</pre>
```

h2o.kurtosis

Kurtosis of a column

## Description

Obtain the kurtosis of a column of a parsed H2O data object.

### Usage

```
h2o.kurtosis(x, ..., na.rm = TRUE)
kurtosis.H2OFrame(x, ..., na.rm = TRUE)
```

## Arguments

An H2OFrame object.
 Further arguments to be passed from or to other methods.
 A logical value indicating whether NA or missing values should be stripped before the computation.

### Value

Returns a list containing the kurtosis for each column (NaN for non-numeric columns).

h2o.levels 179

## **Examples**

```
## Not run:
library(h2o)
h2o.init()
prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.uploadFile(path = prostate_path)
h2o.kurtosis(prostate$AGE)
## End(Not run)</pre>
```

h2o.levels

Return the levels from the column requested column.

# Description

Return the levels from the column requested column.

### Usage

```
h2o.levels(x, i)
```

# Arguments

- x An H2OFrame object.
- i Optional, the index of the column whose domain is to be returned.

# See Also

levels for the base R method.

```
## Not run:
library(h2o)
h2o.init()

iris_hf <- as.h2o(iris)
h2o.levels(iris_hf, 5) # returns "setosa" "versicolor" "virginica"

## End(Not run)</pre>
```

h2o.listTimezones

List all of the Time Zones Acceptable by the H2O cluster.

# Description

List all of the Time Zones Acceptable by the H2O cluster.

# Usage

```
h2o.listTimezones()
```

h2o.list\_all\_extensions

List all H2O registered extensions

# Description

List all H2O registered extensions

# Usage

```
h2o.list_all_extensions()
```

h2o.list\_api\_extensions

List registered API extensions

# Description

List registered API extensions

```
h2o.list_api_extensions()
```

h2o.list\_core\_extensions

List registered core extensions

# Description

List registered core extensions

### Usage

```
h2o.list_core_extensions()
```

h2o.list\_jobs

Return list of jobs performed by the H2O cluster

## Description

Return list of jobs performed by the H2O cluster

## Usage

```
h2o.list_jobs()
```

h2o.loadGrid

Loads previously saved grid with all it's models from the same folder

## Description

Returns a reference to the loaded Grid.

## Usage

```
h2o.loadGrid(grid_path)
```

## **Arguments**

grid\_path

A character string containing the path to the file with the grid saved.

182 h2o.loadModel

#### **Examples**

```
## Not run:
library(h2o)
h2o.init()

iris.hex <- as.h2o(iris)

ntrees_opts = c(1, 5)
learn_rate_opts = c(0.1, 0.01)
size_of_hyper_space = length(ntrees_opts) * length(learn_rate_opts)

hyper_parameters = list(ntrees = ntrees_opts, learn_rate = learn_rate_opts)

# Tempdir is chosen arbitrarily. May be any valid folder on an H2O-supported filesystem.
baseline_grid <- h2o.grid("gbm", grid_id="gbm_grid_test", x=1:4, y=5, training_frame=iris.hex,
hyper_params = hyper_parameters, export_checkpoints_dir = tempdir())

# Remove everything from the cluster or restart it
h2o.removeAll()
grid <- h2o.loadGrid(paste0(tempdir(),"/",baseline_grid@grid_id))

## End(Not run)</pre>
```

h2o.loadModel

Load H2O Model from HDFS or Local Disk

## **Description**

Load a saved H2O model from disk. (Note that ensemble binary models can now be loaded using this method.)

### Usage

```
h2o.loadModel(path)
```

#### **Arguments**

path

The path of the H2O Model to be imported.

#### Value

Returns a H2OModel object of the class corresponding to the type of model loaded.

#### See Also

```
h2o.saveModel,H2OModel
```

h2o.log

### **Examples**

```
## Not run:
# library(h2o)
# h2o.init()
# prostate_path = system.file("extdata", "prostate.csv", package = "h2o")
# prostate = h2o.importFile(path = prostate_path)
# prostate_glm = h2o.glm(y = "CAPSULE", x = c("AGE", "RACE", "PSA", "DCAPS"),
# training_frame = prostate, family = "binomial", alpha = 0.5)
# glmmodel_path = h2o.saveModel(prostate_glm, dir = "/Users/UserName/Desktop")
# glmmodel_load = h2o.loadModel(glmmodel_path)
## End(Not run)
```

h2o.log

Compute the logarithm of x

## Description

Compute the logarithm of x

#### Usage

h2o.log(x)

#### **Arguments**

Х

An H2OFrame object.

## See Also

log for the base R implementation.

184 h2o.log1p

h2o.log10

Compute the log10 of x

## Description

Compute the log10 of x

### Usage

```
h2o.log10(x)
```

## Arguments

Х

An H2OFrame object.

### See Also

log10 for the base R implementation.

## **Examples**

h2o.log1p

Compute the log1p of x

## Description

Compute the log1p of x

## Usage

```
h2o.log1p(x)
```

## Arguments

Х

An H2OFrame object.

h2o.log2

### See Also

log1p for the base R implementation.

## **Examples**

h2o.log2

Compute the log2 of x

## Description

Compute the log2 of x

### Usage

```
h2o.log2(x)
```

## Arguments

Χ

An H2OFrame object.

## See Also

log2 for the base R implementation.

h2o.logloss

|--|

## **Description**

This is helpful when running several pieces of work one after the other on a single H2O cluster and you want to make a notation in the H2O server side log where one piece of work ends and the next piece of work begins.

## Usage

```
h2o.logAndEcho(message)
```

#### **Arguments**

message A character string with the message to write to the log.

#### **Details**

h2o.logAndEcho sends a message to H2O for logging. Generally used for debugging purposes.

h2o.logloss	Retrieve the Log Loss Value	
-------------	-----------------------------	--

## Description

Retrieves the log loss output for a H2OBinomialMetrics or H2OMultinomialMetrics object If "train", "valid", and "xval" parameters are FALSE (default), then the training Log Loss value is returned. If more than one parameter is set to TRUE, then a named vector of Log Losses are returned, where the names are "train", "valid" or "xval".

#### Usage

```
h2o.logloss(object, train = FALSE, valid = FALSE, xval = FALSE)
```

#### **Arguments**

object	a H2OModelMetrics object of the correct type.
train	Retrieve the training Log Loss
valid	Retrieve the validation Log Loss
xval	Retrieve the cross-validation Log Loss

h2o.ls

### **Examples**

```
## Not run:
library(h2o)
h2o.init()
f <- "https://s3.amazonaws.com/h2o-public-test-data/smalldata/junit/cars_20mpg.csv"
cars <- h2o.importFile(f)</pre>
cars["economy_20mpg"] <- as.factor(cars["economy_20mpg"])</pre>
predictors <- c("displacement","power","weight","acceleration","year")</pre>
response <- "economy_20mpg"</pre>
cars.splits <- h2o.splitFrame(data = cars, ratios = .8, seed = 1234)</pre>
train <- cars.splits[[1]]</pre>
valid <- cars.splits[[2]]</pre>
car_drf <- h2o.randomForest(x = predictors,</pre>
                              y = response,
                              training_frame = train,
                              validation_frame = valid)
h2o.logloss(car_drf, train = TRUE, valid = TRUE)
## End(Not run)
```

h2o.1s

List Keys on an H2O Cluster

### **Description**

Accesses a list of object keys in the running instance of H2O.

## Usage

h2o.1s()

### Value

Returns a list of hex keys in the current H2O instance.

```
## Not run:
library(h2o)
h2o.init()
prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.uploadFile(path = prostate_path)
h2o.ls()
## End(Not run)</pre>
```

h2o.mae

h2o.lstrip

Strip set from left

## Description

Return a copy of the target column with leading characters removed. The set argument is a string specifying the set of characters to be removed. If omitted, the set argument defaults to removing whitespace.

### Usage

```
h2o.lstrip(x, set = "")
```

### **Arguments**

x The column whose strings should be lstrip-ed.

set string of characters to be removed

## Examples

```
## Not run:
library(h2o)
h2o.init()
string_to_lstrip <- as.h2o("1234567890")
lstrip_string <- h2o.lstrip(string_to_lstrip, "123") #Remove "123"
## End(Not run)</pre>
```

h2o.mae

Retrieve the Mean Absolute Error Value

#### **Description**

Retrieves the mean absolute error (MAE) value from an H2O model. If "train", "valid", and "xval" parameters are FALSE (default), then the training MAE value is returned. If more than one parameter is set to TRUE, then a named vector of MAEs are returned, where the names are "train", "valid" or "xval".

#### Usage

```
h2o.mae(object, train = FALSE, valid = FALSE, xval = FALSE)
```

h2o.makeGLMModel 189

## Arguments

object	An H2OModel object.
train	Retrieve the training MAE
valid	Retrieve the validation set MAE if a validation set was passed in during model build time.
xval	Retrieve the cross-validation MAE

# Examples

```
## Not run:
library(h2o)
h <- h2o.init()
fr <- as.h2o(iris)

m <- h2o.deeplearning(x = 2:5, y = 1, training_frame = fr)
h2o.mae(m)
## End(Not run)</pre>
```

h2o.makeGLMModel

Set betas of an existing H2O GLM Model

## Description

This function allows setting betas of an existing glm model.

## Usage

```
h2o.makeGLMModel(model, beta)
```

## Arguments

model an H2OModel corresponding from a h2o.glm call.

beta a new set of betas (a named vector)

190 h2o.match

h2o.make\_metrics

Create Model Metrics from predicted and actual values in H2O

### **Description**

Given predicted values (target for regression, class-1 probabilities or binomial or per-class probabilities for multinomial), compute a model metrics object

## Usage

```
h2o.make_metrics(predicted, actuals, domain = NULL, distribution = NULL)
```

#### **Arguments**

predicted An H2OFrame containing predictions
actuals An H2OFrame containing actual values
domain Vector with response factors for classification.

distribution Distribution for regression.

#### Value

Returns an object of the H2OModelMetrics subclass.

### **Examples**

```
## Not run:
library(h2o)
h2o.init()
prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.uploadFile(path = prostate_path)
prostate$CAPSULE <- as.factor(prostate$CAPSULE)
prostate_gbm <- h2o.gbm(3:9, "CAPSULE", prostate)
pred <- h2o.predict(prostate_gbm, prostate)[,3] ## class-1 probability
h2o.make_metrics(pred, prostate$CAPSULE)

## End(Not run)</pre>
```

h2o.match

Value Matching in H2O

## Description

match and %in% return values similar to the base R generic functions.

h2o.max 191

### Usage

```
h2o.match(x, table, nomatch = 0, incomparables = NULL)
match.H2OFrame(x, table, nomatch = 0, incomparables = NULL)
x %in% table
```

## **Arguments**

x a categorical vector from an H2OFrame object with values to be matched.

table an R object to match x against.

nomatch the value to be returned in the case when no match is found.

incomparables a vector of calues that cannot be matched. Any value in x matching a value in

this vector is assigned the nomatch value.

### Value

Returns a vector of the positions of (first) matches of its first argument in its second

### See Also

match for base R implementation.

#### **Examples**

```
## Not run:
h2o.init()
iris_hf <- as.h2o(iris)
h2o.match(iris_hf[, 5], c("setosa", "versicolor"))
## End(Not run)</pre>
```

h2o.max

Returns the maxima of the input values.

## Description

Returns the maxima of the input values.

#### Usage

```
h2o.max(x, na.rm = FALSE)
```

## Arguments

x An H2OFrame object.

na.rm logical. indicating whether missing values should be removed.

h2o.mean

#### See Also

max for the base R implementation.

#### **Examples**

```
## Not run:
library(h2o)
h2o.init()

f <- "http://h2o-public-test-data.s3.amazonaws.com/smalldata/iris/iris_train.csv"
iris <- h2o.importFile(f)
h2o.max(iris["petal_len"], na.rm = TRUE)

## End(Not run)</pre>
```

h2o.mean

Compute the frame's mean by-column (or by-row).

### **Description**

Compute the frame's mean by-column (or by-row).

### Usage

```
h2o.mean(x, na.rm = FALSE, axis = 0, return_frame = FALSE, ...)
## S3 method for class 'H2OFrame'
mean(x, na.rm = FALSE, axis = 0, return_frame = FALSE, ...)
```

## **Arguments**

X	An H2OFrame object.
na.rm	logical. Indicate whether missing values should be removed.
axis	integer. Indicate whether to calculate the mean down a column (0) or across a row (1). NOTE: This is only applied when return_frame is set to TRUE. Otherwise, this parameter is ignored.
return_frame	logical. Indicate whether to return an H2O frame or a list. Default is FALSE (returns a list).
	Further arguments to be passed from or to other methods.

#### Value

Returns a list containing the mean for each column (NaN for non-numeric columns) if return\_frame is set to FALSE. If return\_frame is set to TRUE, then it will return an H2O frame with means per column or row (depends on axis argument).

#### See Also

mean, rowMeans, or colMeans for the base R implementation

### **Examples**

```
## Not run:
library(h2o)
h2o.init()

prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.uploadFile(path = prostate_path)
# Default behavior. Will return list of means per column.
h2o.mean(prostate$AGE)
# return_frame set to TRUE. This will return an H2O Frame
# with mean per row or column (depends on axis argument)
h2o.mean(prostate, na.rm=TRUE, axis=1, return_frame=TRUE)
## End(Not run)</pre>
```

h2o.mean\_per\_class\_error

Retrieve the mean per class error

#### **Description**

Retrieves the mean per class error from an H2OBinomialMetrics. If "train", "valid", and "xval" parameters are FALSE (default), then the training mean per class error value is returned. If more than one parameter is set to TRUE, then a named vector of mean per class errors are returned, where the names are "train", "valid" or "xval".

#### Usage

```
h2o.mean_per_class_error(object, train = FALSE, valid = FALSE, xval = FALSE)
```

#### **Arguments**

object	An H2OBinomialMetrics object.
train	Retrieve the training mean per class error
valid	Retrieve the validation mean per class error
xval	Retrieve the cross-validation mean per class error

#### See Also

h2o.mse for MSE, and h2o.metric for the various threshold metrics. See h2o.performance for creating H2OModelMetrics objects.

#### **Examples**

```
## Not run:
library(h2o)
h2o.init()

prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.uploadFile(prostate_path)

prostate[,2] <- as.factor(prostate[,2])
model <- h2o.gbm(x = 3:9, y = 2, training_frame = prostate, distribution = "bernoulli")
perf <- h2o.performance(model, prostate)
h2o.mean_per_class_error(perf)
h2o.mean_per_class_error(model, train=TRUE)

## End(Not run)</pre>
```

h2o.mean\_residual\_deviance

Retrieve the Mean Residual Deviance value

#### **Description**

Retrieves the Mean Residual Deviance value from an H2O model. If "train", "valid", and "xval" parameters are FALSE (default), then the training Mean Residual Deviance value is returned. If more than one parameter is set to TRUE, then a named vector of Mean Residual Deviances are returned, where the names are "train", "valid" or "xval".

### Usage

```
h2o.mean_residual_deviance(object, train = FALSE, valid = FALSE, xval = FALSE)
```

### Arguments

object An H2OModel object.

train Retrieve the training Mean Residual Deviance

valid Retrieve the validation Mean Residual Deviance

xval Retrieve the cross-validation Mean Residual Deviance

```
## Not run:
library(h2o)
h <- h2o.init()
fr <- as.h2o(iris)
m <- h2o.deeplearning(x = 2:5, y = 1, training_frame = fr)</pre>
```

h2o.median

```
h2o.mean_residual_deviance(m)
## End(Not run)
```

h2o.median

H2O Median

## Description

Compute the median of an H2OFrame.

## Usage

```
h2o.median(x, na.rm = TRUE)
## S3 method for class 'H2OFrame'
median(x, na.rm = TRUE)
```

## Arguments

x An H2OFrame object.na.rm a logical, indicating whether na's are omitted.

#### Value

Returns a list containing the median for each column (NaN for non-numeric columns)

```
## Not run:
library(h2o)
h2o.init()

prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.uploadFile(path = prostate_path)
h2o.median(prostate)

## End(Not run)</pre>
```

h2o.merge

h2o.melt	Converts a frame to key-value representation while optionally skipping
1120.11le1t	NA values. Inverse operation to h20.pivot.
	NA values. Inverse operation to n20.ptvot.

# Description

Pivot the frame designated by the three columns: index, column, and value. Index and column should be of type enum, int, or time. For cases of multiple indexes for a column label, the aggregation method is to pick the first occurrence in the data frame

## Usage

```
h2o.melt(
    x,
    id_vars,
    value_vars = NULL,
    var_name = "variable",
    value_name = "value",
    skipna = FALSE
)
```

## Arguments

Х	an H2OFrame
id_vars	the columns used as identifiers
value_vars	what columns will be converted to key-value pairs (optional, if not specified complement to id_vars will be used)
var_name	name of the key-column (default: "variable")
value_name	name of the value-column (default: "value")
skipna	if enabled, do not include NAs in the result (default: FALSE)

## Value

an unpivoted H2OFrame

h2o.merge 197

### **Description**

Merges two H2OFrame objects with the same arguments and meanings as merge() in base R. However, we do not support all=TRUE, all.x=TRUE and all.y=TRUE. The default method is auto and it will default to the radix method. The radix method will return the correct merge result regardless of duplicated rows in the right frame. In addition, the radix method can perform merge even if you have string columns in your frames. If there are duplicated rows in your rite frame, they will not be included if you use the hash method. The hash method cannot perform merge if you have string columns in your left frame. Hence, we consider the radix method superior to the hash method and is the default method to use.

### Usage

```
h2o.merge(
    x,
    y,
    by = intersect(names(x), names(y)),
    by.x = by,
    by.y = by,
    all = FALSE,
    all.x = all,
    all.y = all,
    method = "auto"
)
```

#### **Arguments**

x, y	H2OFrame objects
by	columns used for merging by default the common names
by.x	x columns used for merging by name or number
by.y	y columns used for merging by name or number
all	TRUE includes all rows in x and all rows in y even if there is no match to the other
all.x	If all.x is true, all rows in the x will be included, even if there is no matching row in y, and vice-versa for all.y.
all.y	see all.x
method	auto(default), radix, hash

```
## Not run:
library(h2o)
h2o.init()
left <- data.frame(fruit = c('apple', 'orange', 'banana', 'lemon', 'strawberry', 'blueberry'),
color <- c('red', 'orange', 'yellow', 'yellow', 'red', 'blue'))
right <- data.frame(fruit = c('apple', 'orange', 'banana', 'lemon', 'strawberry', 'watermelon'),
citrus <- c(FALSE, TRUE, FALSE, TRUE, FALSE, FALSE))
left_hf <- as.h2o(left)</pre>
```

198 h2o.metric

```
right_hf <- as.h2o(right)
merged <- h2o.merge(left_hf, right_hf, all.x = TRUE)
## End(Not run)</pre>
```

h2o.metric

H2O Model Metric Accessor Functions

#### **Description**

A series of functions that retrieve model metric details.

### Usage

```
h2o.metric(object, thresholds, metric, transform = NULL)
h2o.F0point5(object, thresholds)
h2o.F1(object, thresholds)
h2o.F2(object, thresholds)
h2o.accuracy(object, thresholds)
h2o.error(object, thresholds)
h2o.maxPerClassError(object, thresholds)
h2o.mean_per_class_accuracy(object, thresholds)
h2o.mcc(object, thresholds)
h2o.precision(object, thresholds)
h2o.tpr(object, thresholds)
h2o.fpr(object, thresholds)
h2o.fnr(object, thresholds)
h2o.tnr(object, thresholds)
h2o.recall(object, thresholds)
h2o.sensitivity(object, thresholds)
h2o.fallout(object, thresholds)
```

h2o.metric

```
h2o.missrate(object, thresholds)
h2o.specificity(object, thresholds)
```

#### **Arguments**

object An H2OModelMetrics object of the correct type.

thresholds (Optional) A value or a list of values between 0.0 and 1.0. If not set, then all

thresholds will be returned. If "max", then the threshold maximizing the metric

will be used.

metric (Optional) the metric to retrieve. If not set, then all metrics will be returned.

transform (Optional) a list describing a transformer for the given metric, if any. e.g. trans-

form=list(op=foo\_fn, name="foo") will rename the given metric to "foo" and

apply function foo\_fn to the metric values.

#### **Details**

Many of these functions have an optional thresholds parameter. Currently only increments of 0.1 are allowed. If not specified, the functions will return all possible values. Otherwise, the function will return the value for the indicated threshold.

Currently, the these functions are only supported by H2OBinomialMetrics objects.

### Value

Returns either a single value, or a list of values.

#### See Also

h2o. auc for AUC, h2o.giniCoef for the GINI coefficient, and h2o.mse for MSE. See h2o.performance for creating H2OModelMetrics objects.

```
## Not run:
library(h2o)
h2o.init()

prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.uploadFile(prostate_path)

prostate$CAPSULE <- as.factor(prostate$CAPSULE)
model <- h2o.gbm(x = 3:9, y = 2, training_frame = prostate, distribution = "bernoulli")
perf <- h2o.performance(model, prostate)
h2o.F1(perf)

## End(Not run)</pre>
```

200 h2o.mktime

h2o.min

Returns the minima of the input values.

### **Description**

Returns the minima of the input values.

## Usage

```
h2o.min(x, na.rm = FALSE)
```

## Arguments

x An H2OFrame object.

na.rm logical. indicating whether missing values should be removed.

### See Also

min for the base R implementation.

## **Examples**

```
## Not run:
library(h2o)
h2o.init()

f <- "http://h2o-public-test-data.s3.amazonaws.com/smalldata/iris/iris_train.csv"
iris <- h2o.importFile(f)
h2o.min(iris["sepal_len"], na.rm = TRUE)

## End(Not run)</pre>
```

h2o.mktime

Compute msec since the Unix Epoch

### **Description**

Compute msec since the Unix Epoch

h2o.mojo\_predict\_csv 201

### Usage

```
h2o.mktime(
    year = 1970,
    month = 0,
    day = 0,
    hour = 0,
    minute = 0,
    second = 0,
    msec = 0
)
```

### **Arguments**

```
year Defaults to 1970
month zero based (months are 0 to 11)
day zero based (days are 0 to 30)
hour hour
minute minute
second second
msec msec
```

## **Examples**

```
## Not run:
library(h2o)
h2o.init()

x = as.h2o(c(2018, 3, 2, 6, 32, 0, 0))
h2o.mktime(x)

## End(Not run)
```

### **Description**

Provides the method h2o.mojo\_predict\_csv with which you can predict a MOJO model from R.

# Usage

```
h2o.mojo_predict_csv(
  input_csv_path,
  mojo_zip_path,
  output_csv_path = NULL,
  genmodel_jar_path = NULL,
```

202 h2o.mojo\_predict\_df

```
classpath = NULL,
  java_options = NULL,
  verbose = F,
  setInvNumNA = F
)
```

#### **Arguments**

input\_csv\_path Path to input CSV file.

mojo\_zip\_path Path to MOJO zip downloaded from H2O.

output\_csv\_path

Optional, path to the output CSV file with computed predictions. If NULL (default), then predictions will be saved as prediction.csv in the same folder as the MOJO zip.

genmodel\_jar\_path

Optional, path to genmodel jar file. If NULL (default) then the h2o-genmodel.jar

in the same folder as the MOJO zip will be used.

classpath Optional, specifies custom user defined classpath which will be used when scor-

ing. If NULL (default) then the default classpath for this MOJO model will be

used.

java\_options Optional, custom user defined options for Java. By default '-Xmx4g -XX:ReservedCodeCacheSize=256m

is used.

verbose Optional, if TRUE, then additional debug information will be printed. FALSE

by default.

setInvNumNA Optional, if TRUE, then then for an string that cannot be parsed into a number an

N/A value will be produced, if false the command will fail. FALSE by default.

#### Value

Returns a data.frame containing computed predictions

### Description

Provides the method h2o.mojo\_predict\_df with which you can predict a MOJO model from R.

### Usage

```
h2o.mojo_predict_df(
  frame,
  mojo_zip_path,
  genmodel_jar_path = NULL,
  classpath = NULL,
```

h2o.month 203

```
java_options = NULL,
verbose = F,
setInvNumNA = F
)
```

#### **Arguments**

frame data.frame to score.

mojo\_zip\_path Path to MOJO zip downloaded from H2O.

genmodel\_jar\_path

Optional, path to genmodel jar file. If NULL (default) then the h2o-genmodel.jar

in the same folder as the MOJO zip will be used.

classpath Optional, specifies custom user defined classpath which will be used when scor-

ing. If NULL (default) then the default classpath for this MOJO model will be

used.

java\_options Optional, custom user defined options for Java. By default '-Xmx4g -XX:ReservedCodeCacheSize=256m

is used.

verbose Optional, if TRUE, then additional debug information will be printed. FALSE

by default.

setInvNumNA Optional, if TRUE, then then for an string that cannot be parsed into a number an

N/A value will be produced, if false the command will fail. FALSE by default.

#### Value

Returns a data.frame containing computed predictions

h2o.month

Convert Milliseconds to Months in H2O Datasets

### Description

Converts the entries of an H2OFrame object from milliseconds to months (on a 1 to 12 scale).

### Usage

```
h2o.month(x)
month(x)
## S3 method for class 'H20Frame'
month(x)
```

#### **Arguments**

x An H2OFrame object.

204 h2o.mse

#### Value

An H2OFrame object containing the entries of x converted to months of the year.

#### See Also

```
h2o.year
```

h2o.mse

Retrieves Mean Squared Error Value

### **Description**

Retrieves the mean squared error value from an H2OModelMetrics object. If "train", "valid", and "xval" parameters are FALSE (default), then the training MSEvalue is returned. If more than one parameter is set to TRUE, then a named vector of MSEs are returned, where the names are "train", "valid" or "xval".

### Usage

```
h2o.mse(object, train = FALSE, valid = FALSE, xval = FALSE)
```

## Arguments

object An H2OModelMetrics object of the correct type.

train Retrieve the training MSE valid Retrieve the validation MSE

xval Retrieve the cross-validation MSE

## **Details**

This function only supports H2OBinomialMetrics, H2OMultinomialMetrics, and H2ORegressionMetrics objects.

#### See Also

h2o.auc for AUC, h2o.mse for MSE, and h2o.metric for the various threshold metrics. See h2o.performance for creating H2OModelMetrics objects.

```
## Not run:
library(h2o)
h2o.init()

prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.uploadFile(prostate_path)</pre>
```

h2o.nacnt 205

```
prostate[,2] <- as.factor(prostate[,2])
model <- h2o.gbm(x = 3:9, y = 2, training_frame = prostate, distribution = "bernoulli")
perf <- h2o.performance(model, prostate)
h2o.mse(perf)
## End(Not run)</pre>
```

h2o.nacnt

Count of NAs per column

## Description

Gives the count of NAs per column.

## Usage

h2o.nacnt(x)

#### **Arguments**

Х

An H2OFrame object.

## Value

Returns a list containing the count of NAs per column

```
## Not run:
library(h2o)
h2o.init()

iris_hf <- as.h2o(iris)
h2o.nacnt(iris_hf) # should return all 0s
h2o.insertMissingValues(iris_hf)
h2o.nacnt(iris_hf)

## End(Not run)</pre>
```

206 h2o.naiveBayes

h2o.naiveBayes

Compute naive Bayes probabilities on an H2O dataset.

#### **Description**

The naive Bayes classifier assumes independence between predictor variables conditional on the response, and a Gaussian distribution of numeric predictors with mean and standard deviation computed from the training dataset. When building a naive Bayes classifier, every row in the training dataset that contains at least one NA will be skipped completely. If the test dataset has missing values, then those predictors are omitted in the probability calculation during prediction.

#### Usage

```
h2o.naiveBayes(
 х,
 у,
  training_frame,
 model_id = NULL,
  nfolds = 0,
  seed = -1,
  fold_assignment = c("AUTO", "Random", "Modulo", "Stratified"),
  fold_column = NULL,
  keep_cross_validation_models = TRUE,
  keep_cross_validation_predictions = FALSE,
  keep_cross_validation_fold_assignment = FALSE,
  validation_frame = NULL,
  ignore_const_cols = TRUE,
  score_each_iteration = FALSE,
  balance_classes = FALSE,
  class_sampling_factors = NULL,
 max_after_balance_size = 5,
 max_hit_ratio_k = 0,
  laplace = 0,
  threshold = 0.001,
 min\_sdev = 0.001,
  eps = 0,
  eps\_sdev = 0,
 min_prob = 0.001,
  eps_prob = 0,
  compute_metrics = TRUE,
 max_runtime_secs = 0,
  export_checkpoints_dir = NULL
)
```

#### **Arguments**

Χ

(Optional) A vector containing the names or indices of the predictor variables to use in building the model. If x is missing, then all columns except y are used.

h2o.naiveBayes 207

y The name or column index of the response variable in the data. The response

must be either a numeric or a categorical/factor variable. If the response is numeric, then a regression model will be trained, otherwise it will train a classi-

fication model.

training\_frame Id of the training data frame.

model\_id Destination id for this model; auto-generated if not specified.

nfolds Number of folds for K-fold cross-validation (0 to disable or  $\geq$  2). Defaults to

0.

seed Seed for random numbers (affects certain parts of the algo that are stochastic

and those might or might not be enabled by default). Defaults to -1 (time-based

random number).

fold\_assignment

Cross-validation fold assignment scheme, if fold\_column is not specified. The 'Stratified' option will stratify the folds based on the response variable, for classification problems. Must be one of: "AUTO", "Random", "Modulo", "Strati-

fied". Defaults to AUTO.

fold\_column Column with cross-validation fold index assignment per observation.

keep\_cross\_validation\_models

Logical. Whether to keep the cross-validation models. Defaults to TRUE.

keep\_cross\_validation\_predictions

Logical. Whether to keep the predictions of the cross-validation models. Defaults to FALSE.

keep\_cross\_validation\_fold\_assignment

Logical. Whether to keep the cross-validation fold assignment. Defaults to FALSE.

validation\_frame

Id of the validation data frame.

ignore\_const\_cols

Logical. Ignore constant columns. Defaults to TRUE.

score\_each\_iteration

Logical. Whether to score during each iteration of model training. Defaults to FALSE.

balance\_classes

Logical. Balance training data class counts via over/under-sampling (for imbalanced data). Defaults to FALSE.

class\_sampling\_factors

Desired over/under-sampling ratios per class (in lexicographic order). If not specified, sampling factors will be automatically computed to obtain class balance during training. Requires balance\_classes.

max\_after\_balance\_size

Maximum relative size of the training data after balancing class counts (can be less than 1.0). Requires balance\_classes. Defaults to 5.0.

max\_hit\_ratio\_k

Max. number (top K) of predictions to use for hit ratio computation (for multiclass only, 0 to disable) Defaults to 0.

208 h2o.names

laplace	Laplace smoothing parameter Defaults to 0.	
threshold	This argument is deprecated, use 'min_sdev' instead. The minimum standard deviation to use for observations without enough data. Must be at least 1e-10.	
min_sdev	The minimum standard deviation to use for observations without enough data. Must be at least 1e-10.	
eps	This argument is deprecated, use 'eps_sdev' instead. A threshold cutoff to deal with numeric instability, must be positive.	
eps_sdev	A threshold cutoff to deal with numeric instability, must be positive.	
min_prob	Min. probability to use for observations with not enough data.	
eps_prob	Cutoff below which probability is replaced with min_prob.	
compute_metrics		
	Logical. Compute metrics on training data Defaults to TRUE.	
max_runtime_secs		
	Maximum allowed runtime in seconds for model training. Use 0 to disable.	
	Defaults to 0.	
export_checkpoints_dir		
	Automatically export generated models to this directory.	

### Value

an object of class H2OBinomialModel if the response has two categorical levels, and H2OMultinomialModel otherwise.

## **Examples**

```
## Not run:
h2o.init()
votes_path <- system.file("extdata", "housevotes.csv", package = "h2o")
votes <- h2o.uploadFile(path = votes_path, header = TRUE)
h2o.naiveBayes(x = 2:17, y = 1, training_frame = votes, laplace = 3)
## End(Not run)</pre>
```

h2o.names

Column names of an H2OFrame

## Description

Column names of an H2OFrame

## Usage

h2o.names(x)

## Arguments

Χ

An H2OFrame object.

h2o.na\_omit 209

#### See Also

names for the base R implementation.

## **Examples**

```
## Not run:
library(h2o)
h2o.init()

f <- "http://h2o-public-test-data.s3.amazonaws.com/smalldata/iris/iris_train.csv"
iris <- h2o.importFile(f)
h2o.names(iris)
## End(Not run)</pre>
```

h2o.na\_omit

Remove Rows With NAs

### **Description**

Remove Rows With NAs

### Usage

```
h2o.na_omit(object, ...)
```

### **Arguments**

```
object H2OFrame object
... Ignored
```

#### Value

Returns an H2OFrame object containing non-NA rows.

210 h2o.ncol

h2o.nchar

String length

## Description

String length

# Usage

```
h2o.nchar(x)
```

## Arguments

Х

The column whose string lengths will be returned.

## **Examples**

```
## Not run:
library(h2o)
h2o.init()
string_to_nchar <- as.h2o("r tutorial")
nchar_string <- h2o.nchar(string_to_nchar)
## End(Not run)</pre>
```

h2o.ncol

Return the number of columns present in x.

## Description

Return the number of columns present in x.

## Usage

```
h2o.ncol(x)
```

## **Arguments**

Х

An H2OFrame object.

#### See Also

```
ncol for the base R implementation.
```

h2o.networkTest 211

### **Examples**

```
## Not run:
library(h2o)
h2o.init()

f <- "http://h2o-public-test-data.s3.amazonaws.com/smalldata/iris/iris_train.csv"
iris <- h2o.importFile(f)
h2o.ncol(iris)

## End(Not run)</pre>
```

h2o.networkTest

View Network Traffic Speed

## Description

View speed with various file sizes.

### Usage

```
h2o.networkTest()
```

## Value

Returns a table listing the network speed for 1B, 10KB, and 10MB.

h2o.nlevels

Get the number of factor levels for this frame.

## Description

Get the number of factor levels for this frame.

### Usage

```
h2o.nlevels(x)
```

# Arguments

Х

An H2OFrame object.

#### See Also

nlevels for the base R method.

212 h2o.no\_progress

### **Examples**

```
## Not run:
library(h2o)
h2o.init()

f <- "https://s3.amazonaws.com/h2o-public-test-data/smalldata/junit/cars_20mpg.csv"
cars <- h2o.importFile(f)
h2o.nlevels(cars)

## End(Not run)</pre>
```

h2o.no\_progress

Disable Progress Bar

## Description

Disable Progress Bar

#### Usage

```
h2o.no_progress()
```

```
## Not run:
library(h2o)
h2o.init()
h2o.no_progress()
f <- "http://h2o-public-test-data.s3.amazonaws.com/smalldata/iris/iris_wheader.csv"
iris <- h2o.importFile(f)</pre>
iris["class"] <- as.factor(iris["class"])</pre>
predictors <- c("sepal_len", "sepal_wid", "petal_len", "petal_wid")</pre>
splits <- h2o.splitFrame(iris, ratios = 0.8, seed = 1234)</pre>
train <- splits[[1]]</pre>
valid <- splits[[2]]</pre>
iris_km <- h2o.kmeans(x = predictors,</pre>
                        training_frame = train,
                        validation_frame = valid,
                        k = 10, estimate_k = TRUE,
                        standardize = FALSE, seed = 1234)
## End(Not run)
```

h2o.nrow 213

h2o.nrow

*Return the number of rows present in x.* 

## **Description**

Return the number of rows present in x.

### Usage

```
h2o.nrow(x)
```

# Arguments

Х

An H2OFrame object.

#### See Also

nrow for the base R implementation.

## **Examples**

```
## Not run:
library(h2o)
h2o.init()

f <- "https://s3.amazonaws.com/h2o-public-test-data/smalldata/junit/cars_20mpg.csv"
cars <- h2o.importFile(f)
h2o.nrow(cars)

## End(Not run)</pre>
```

h2o.null\_deviance

Retrieve the null deviance

## **Description**

If "train", "valid", and "xval" parameters are FALSE (default), then the training null deviance value is returned. If more than one parameter is set to TRUE, then a named vector of null deviances are returned, where the names are "train", "valid" or "xval".

## Usage

```
h2o.null_deviance(object, train = FALSE, valid = FALSE, xval = FALSE)
```

214 h2o.null\_dof

### **Arguments**

object	An H2OModel or H2OModelMetrics
train	Retrieve the training null deviance
valid	Retrieve the validation null deviance
xval	Retrieve the cross-validation null deviance

#### **Examples**

h2o.null\_dof

Retrieve the null degrees of freedom

## Description

If "train", "valid", and "xval" parameters are FALSE (default), then the training null degrees of freedom value is returned. If more than one parameter is set to TRUE, then a named vector of null degrees of freedom are returned, where the names are "train", "valid" or "xval".

### Usage

```
h2o.null_dof(object, train = FALSE, valid = FALSE, xval = FALSE)
```

### Arguments

object	An H2OModel or H2OModelMetrics
train	Retrieve the training null degrees of freedom
valid	Retrieve the validation null degrees of freedom
xval	Retrieve the cross-validation null degrees of freedom

h2o.num\_iterations 215

#### **Examples**

h2o.num\_iterations

Retrieve the number of iterations.

## Description

Retrieve the number of iterations.

### Usage

```
h2o.num_iterations(object)
```

### **Arguments**

object

An H2OClusteringModel object.

216 h2o.openLog

h2o.num\_valid\_substrings

Count of substrings >= 2 chars that are contained in file

## Description

Find the count of all possible substrings >= 2 chars that are contained in the specified line-separated text file.

### Usage

```
h2o.num_valid_substrings(x, path)
```

### **Arguments**

x The column on which to calculate the number of valid substrings.

path Path to text file containing line-separated strings to be referenced.

h2o.openLog

View H2O R Logs

### **Description**

Open existing logs of H2O R POST commands and error resposnes on local disk. Used primarily for debugging purposes.

### Usage

```
h2o.openLog(type)
```

## Arguments

type

Currently unimplemented.

## See Also

h2o.startLogging,h2o.stopLogging,h2o.clearLog

h2o.parseRaw 217

## **Examples**

```
## Not run:
h2o.init()

h2o.startLogging()
australia_path = system.file("extdata", "australia.csv", package = "h2o")
australia = h2o.importFile(path = australia_path)
h2o.stopLogging()

# Not run to avoid windows being opened during R CMD check
# h2o.openLog("Command")
# h2o.openLog("Error")

## End(Not run)
```

h2o.parseRaw

H2O Data Parsing

### **Description**

The second phase in the data ingestion step.

## Usage

```
h2o.parseRaw(
  data,
  pattern = "",
  destination_frame = "",
  header = NA,
  sep = "",
  col.names = NULL,
  col.types = NULL,
  na.strings = NULL,
  blocking = FALSE,
  parse_type = NULL,
  chunk_size = NULL,
  decrypt_tool = NULL,
  skipped_columns = NULL,
  custom_non_data_line_markers = NULL
)
```

#### **Arguments**

```
data An H2OFrame object to be parsed.

pattern (Optional) Character string containing a regular expression to match file(s) in the folder.

destination_frame (Optional) The hex key assigned to the parsed file.
```

218 h2o.parseSetup

header	(Optional) A logical value indicating whether the first row is the column header. If missing, H2O will automatically try to detect the presence of a header.
sep	(Optional) The field separator character. Values on each line of the file are separated by this character. If sep = "", the parser will automatically detect the separator.
col.names	(Optional) An H2OFrame object containing a single delimited line with the column names for the file. If skipped_columns are specified, only list column names of columns that are not skipped.
col.types	(Optional) A vector specifying the types to attempt to force over columns. If skipped_columns are specified, only list column types of columns that are not skipped.
na.strings	(Optional) H2O will interpret these strings as missing.
blocking	(Optional) Tell H2O parse call to block synchronously instead of polling. This can be faster for small datasets but loses the progress bar.
parse_type	(Optional) Specify which parser type H2O will use. Valid types are "ARFF", "XLS", "CSV", "SVMLight"
chunk_size	size of chunk of (input) data in bytes
decrypt_tool	(Optional) Specify a Decryption Tool (key-reference acquired by calling h2o.decryptionSetup.
skipped_columns	
	a list of column indices to be excluded from parsing
custom_non_data_line_markers	
	(Optional) If a line in imported file starts with any character in given string it

#### (Optional) if a

(Optional) If a line in imported file starts with any character in given string it will NOT be imported. Empty string means all lines are imported, NULL means that default behaviour for given format will be used

# **Details**

Parse the Raw Data produced by the import phase.

## See Also

 $h2o.importFile,\, h2o.parseSetup$ 

h2o.parseSetup Get a parse setup back for the staged data.	h2o.parseSetup	Get a parse setup back for the staged data.	
--	----------------	---	--

# Description

Get a parse setup back for the staged data.

h2o.parseSetup 219

### Usage

```
h2o.parseSetup(
  data,
  pattern = "",
  destination_frame = "",
  header = NA,
  sep = "",
  col.names = NULL,
  col.types = NULL,
  na.strings = NULL,
  parse_type = NULL,
  chunk_size = NULL,
  decrypt_tool = NULL,
  skipped_columns = NULL,
  custom_non_data_line_markers = NULL)
```

### Arguments

data An H2OFrame object to be parsed.

pattern (Optional) Character string containing a regular expression to match file(s) in

the folder.

destination\_frame

(Optional) The hex key assigned to the parsed file.

header (Optional) A logical value indicating whether the first row is the column header.

If missing, H2O will automatically try to detect the presence of a header.

sep (Optional) The field separator character. Values on each line of the file are sep-

arated by this character. If sep = "", the parser will automatically detect the

separator.

col.names (Optional) An H2OFrame object containing a single delimited line with the col-

umn names for the file. If skipped\_columns are specified, only list column

names of columns that are not skipped.

col. types (Optional) A vector specifying the types to attempt to force over columns. If

skipped\_columns are specified, only list column types of columns that are not

skipped.

na.strings (Optional) H2O will interpret these strings as missing.

parse\_type (Optional) Specify which parser type H2O will use. Valid types are "ARFF",

"XLS", "CSV", "SVMLight"

chunk\_size size of chunk of (input) data in bytes

decrypt\_tool (Optional) Specify a Decryption Tool (key-reference acquired by calling h2o.decryptionSetup.

skipped\_columns

a list of column indices to be excluded from parsing

custom\_non\_data\_line\_markers

(Optional) If a line in imported file starts with any character in given string it will NOT be imported. Empty string means all lines are imported, NULL means

that default behaviour for given format will be used

220 h2o.partialPlot

### See Also

h2o.parseRaw

h2o.partialPlot Partial Dependence Plots

## **Description**

Partial dependence plot gives a graphical depiction of the marginal effect of a variable on the response. The effect of a variable is measured in change in the mean response. Note: Unlike random-Forest's partialPlot when plotting partial dependence the mean response (probabilities) is returned rather than the mean of the log class probability.

## Usage

```
h2o.partialPlot(
  object,
  data,
  cols,
  destination_key,
  nbins = 20,
  plot = TRUE,
  plot_stddev = TRUE,
  weight_column = -1,
  include_na = FALSE,
  user_splits = NULL,
  col_pairs_2dpdp = NULL,
  save_to = NULL,
  row_index = -1
)
```

## **Arguments**

object An H2OModel object.

data An H2OFrame object used for scoring and constructing the plot.

cols Feature(s) for which partial dependence will be calculated.

destination\_key

An key reference to the created partial dependence tables in H2O.

nbins Number of bins used. For categorical columns make sure the number of bins

exceeds the level count. If you enable add\_missing\_NA, the returned length

will be nbin+1.

plot A logical specifying whether to plot partial dependence table.

plot\_stddev A logical specifying whether to add std err to partial dependence plot.

weight\_column A string denoting which column of data should be used as the weight column.

h2o.performance 221

include\_na A logical specifying whether missing value should be included in the Feature

values.

user\_splits A two-level nested list containing user defined split points for pdp plots for each

column. If there are two columns using user defined split points, there should be two lists in the nested list. Inside each list, the first element is the column name

followed by values defined by the user.

col\_pairs\_2dpdp

A two-level nested list like this: col\_pairs\_2dpdp = list(c("col1\_name", "col2\_name"), c("col1\_name", "col3\_name"), ...,) where a 2D partial plots will be generated for col1\_name, col2\_name pair, for col1\_name, col3\_name pair and whatever other pairs that are specified in the nested list.

save\_to

Fully qualified prefix of the image files the resulting plots should be saved to, e.g. '/home/user/pdp'. Plots for each feature are saved separately in PNG format, each file receives a suffix equal to the corresponding feature name, e.g. '/home/user/pdp\_AGE.png'. If the files already exists, they will be overridden. Files are only saves if plot = TRUE (default).

row\_index

Row for which partial dependence will be calculated instead of the whole input frame.

#### Value

Plot and list of calculated mean response tables for each feature requested.

h2o.performance

## **Description**

Given a trained h2o model, compute its performance on the given dataset. However, if the dataset does not contain the response/target column, no performance will be returned. Instead, a warning message will be printed.

## Usage

```
h2o.performance(
  model,
  newdata = NULL,
  train = FALSE,
  valid = FALSE,
  xval = FALSE,
  data = NULL
)
```

### **Arguments**

model	An H2OModel object
newdata	An H2OFrame. The model will make predictions on this dataset, and subsequently score them. The dataset should match the dataset that was used to train the model, in terms of column names, types, and dimensions. If newdata is passed in, then train, valid, and xval are ignored.
train	A logical value indicating whether to return the training metrics (constructed during training).
	Note: when the trained h2o model uses balance_classes, the training metrics constructed during training will be from the balanced training dataset. For more information visit: https://0xdata.atlassian.net/browse/TN-9
valid	A logical value indicating whether to return the validation metrics (constructed during training).
xval	A logical value indicating whether to return the cross-validation metrics (constructed during training).
data	(DEPRECATED) An H2OFrame. This argument is now called 'newdata'.

## Value

Returns an object of the H2OModelMetrics subclass.

```
## Not run:
library(h2o)
h2o.init()
prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.uploadFile(path = prostate_path)
prostate$CAPSULE <- as.factor(prostate$CAPSULE)
prostate_gbm <- h2o.gbm(3:9, "CAPSULE", prostate)
h2o.performance(model = prostate_gbm, newdata=prostate)</pre>
```

h2o.pivot 223

```
## If model uses balance_classes
## the results from train = TRUE will not match the results from newdata = prostate.hex
prostate_gbm_balanced <- h2o.gbm(3:9, "CAPSULE", prostate, balance_classes = TRUE)
h2o.performance(model = prostate_gbm_balanced, newdata = prostate)
h2o.performance(model = prostate_gbm_balanced, train = TRUE)
## End(Not run)</pre>
```

h2o.pivot

Pivot a frame

## **Description**

Pivot the frame designated by the three columns: index, column, and value. Index and column should be of type enum, int, or time. For cases of multiple indexes for a column label, the aggregation method is to pick the first occurrence in the data frame

## Usage

```
h2o.pivot(x, index, column, value)
```

## **Arguments**

x an H2OFrame

index the column where pivoted rows should be aligned on

column the column to pivot

value values of the pivoted table

### Value

An H2OFrame with columns from the columns arg, aligned on the index arg, with values from values arg

224 h2o.prcomp

h2o.prcomp

Principal component analysis of an H2O data frame

### **Description**

Principal components analysis of an H2O data frame using the power method to calculate the singular value decomposition of the Gram matrix.

# Usage

```
h2o.prcomp(
  training_frame,
 model_id = NULL,
  validation_frame = NULL,
  ignore_const_cols = TRUE,
  score_each_iteration = FALSE,
  transform = c("NONE", "STANDARDIZE", "NORMALIZE", "DEMEAN", "DESCALE"),
  pca_method = c("GramSVD", "Power", "Randomized", "GLRM"),
 pca_impl = c("MTJ_EVD_DENSEMATRIX", "MTJ_EVD_SYMMMATRIX", "MTJ_SVD_DENSEMATRIX",
    "JAMA"),
  k = 1,
 max_iterations = 1000,
 use_all_factor_levels = FALSE,
  compute_metrics = TRUE,
  impute_missing = FALSE,
  seed = -1,
 max_runtime_secs = 0,
  export_checkpoints_dir = NULL
)
```

## **Arguments**

h2o.prcomp 225

pca\_method

Specify the algorithm to use for computing the principal components: GramSVD - uses a distributed computation of the Gram matrix, followed by a local SVD; Power - computes the SVD using the power iteration method (experimental); Randomized - uses randomized subspace iteration method; GLRM - fits a generalized low-rank model with L2 loss function and no regularization and solves for the SVD using local matrix algebra (experimental) Must be one of: "GramSVD", "Power", "Randomized", "GLRM". Defaults to GramSVD.

pca\_impl

Specify the implementation to use for computing PCA (via SVD or EVD): MTJ EVD DENSEMATRIX - eigenvalue decompositions for dense matrix using MTJ; MTJ\_EVD\_SYMMMATRIX - eigenvalue decompositions for symmetric matrix using MTJ; MTJ SVD DENSEMATRIX - singular-value decompositions for dense matrix using MTJ; JAMA - eigenvalue decompositions for dense matrix using JAMA. References: JAMA - http://math.nist.gov/javanumerics/jama/;

MTJ - https://github.com/fommil/matrix-toolkits-java/ Must be one of: "MTJ EVD DENSEMATRIX",

"MTJ\_EVD\_SYMMMATRIX", "MTJ\_SVD\_DENSEMATRIX", "JAMA".

Rank of matrix approximation Defaults to 1.

max\_iterations Maximum training iterations Defaults to 1000.

use\_all\_factor\_levels

Logical. Whether first factor level is included in each categorical expansion Defaults to FALSE.

compute\_metrics

Logical. Whether to compute metrics on the training data Defaults to TRUE.

impute\_missing Logical. Whether to impute missing entries with the column mean Defaults to FALSE.

seed

k

Seed for random numbers (affects certain parts of the algo that are stochastic and those might or might not be enabled by default). Defaults to -1 (time-based random number).

max\_runtime\_secs

Maximum allowed runtime in seconds for model training. Use 0 to disable. Defaults to 0.

export\_checkpoints\_dir

Automatically export generated models to this directory.

## Value

an object of class H2ODimReductionModel.

226 h2o.predict\_json

### **Examples**

```
## Not run:
library(h2o)
h2o.init()
australia_path <- system.file("extdata", "australia.csv", package = "h2o")
australia <- h2o.uploadFile(path = australia_path)
h2o.prcomp(training_frame = australia, k = 8, transform = "STANDARDIZE")
## End(Not run)</pre>
```

h2o.predict

Predict on an H2O Model

# Description

Predict on an H2O Model

## Usage

```
h2o.predict(object, newdata, ...)
```

## **Arguments**

object a fitted model object for which prediction is desired.

newdata An H2OFrame object in which to look for variables with which to predict.

... additional arguments to pass on.

### Value

Returns an H2OFrame object with probabilites and default predictions.

h2o.predict\_json

H2O Prediction from R without having H2O running

# Description

Provides the method h2o.predict with which you can predict a MOJO or POJO Jar model from R.

## Usage

```
h2o.predict_json(model, json, genmodelpath, labels, classpath, javaoptions)
```

h2o.print 227

### **Arguments**

model String with file name of MOJO or POJO Jar

json JSON String with inputs to model

genmodelpath (Optional) path name to h2o-genmodel.jar, if not set defaults to same dir as

MOJO

labels (Optional) if TRUE then show output labels in result

classpath (Optional) Extra items for the class path of where to look for Java classes, e.g.,

h2o-genmodel.jar

javaoptions (Optional) Java options string, default if "-Xmx4g"

## Value

Returns an object with the prediction result

## **Examples**

```
## Not run:
library(h2o)
h2o.predict_json('~/GBM_model_python_1473313897851_6.zip', '{"C7":1}')
h2o.predict_json('~/GBM_model_python_1473313897851_6.zip', '{"C7":1}', c(".", "lib"))
## End(Not run)
```

h2o.print

Print An H2OFrame

### **Description**

Print An H2OFrame

### Usage

```
h2o.print(x, n = 6L)
```

## **Arguments**

x An H2OFrame object

n An (Optional) A single integer. If positive, number of rows in x to return. If

negative, all but the n first/last number of rows in x. Anything bigger than 20 rows will require asking the server (first 20 rows are cached on the client).

228 h2o.prod

## **Examples**

```
## Not run:
library()
h2o.init()

f <- "http://h2o-public-test-data.s3.amazonaws.com/smalldata/iris/iris_train.csv"
iris <- h2o.importFile(f)
h2o.print(iris["species"], n = 15)

## End(Not run)</pre>
```

h2o.prod

Return the product of all the values present in its arguments.

# Description

Return the product of all the values present in its arguments.

# Usage

```
h2o.prod(x)
```

# Arguments

Х

An H2OFrame object.

## See Also

prod for the base R implementation.

```
## Not run:
library(h2o)
h2o.init()

f <- "http://h2o-public-test-data.s3.amazonaws.com/smalldata/iris/iris_train.csv"
iris <- h2o.importFile(f)
h2o.prod(iris["petal_len"])
## End(Not run)</pre>
```

h2o.proj\_archetypes 229

h2o.proj\_archetypes

Convert Archetypes to Features from H2O GLRM Model

### **Description**

Project each archetype in an H2O GLRM model into the corresponding feature space from the H2O training frame.

## Usage

```
h2o.proj_archetypes(object, data, reverse_transform = FALSE)
```

# Arguments

object

An H2ODimReductionModel object that represents the model containing archetypes

to be projected.

data

An H2OFrame object representing the training data for the H2O GLRM model.

reverse\_transform

(Optional) A logical value indicating whether to reverse the transformation from model-building by re-scaling columns and adding back the offset to each column of the projected archetypes.

#### Value

Returns an H2OFrame object containing the projection of the archetypes down into the original feature space, where each row is one archetype.

## See Also

h2o.glrm for making an H2ODimReductionModel.

230 h2o.psvm

h2o.psvm

Trains a Support Vector Machine model on an H2O dataset

## **Description**

Alpha version. Supports only binomial classification problems.

## Usage

```
h2o.psvm(
  х,
  у,
  training_frame,
  model_id = NULL,
  validation_frame = NULL,
  ignore_const_cols = TRUE,
  hyper_param = 1,
  kernel_type = c("gaussian"),
  gamma = -1,
  rank_ratio = -1,
  positive_weight = 1,
  negative_weight = 1,
  disable_training_metrics = TRUE,
  sv_{threshold} = 1e-04,
  fact_threshold = 1e-05,
  feasible_threshold = 0.001,
  surrogate_gap_threshold = 0.001,
  mu_factor = 10,
 max_iterations = 200,
  seed = -1
)
```

## **Arguments**

(Optional) A vector containing the names or indices of the predictor variables to Х use in building the model. If x is missing, then all columns except y are used. The name or column index of the response variable in the data. The response У must be either a binary categorical/factor variable or a numeric variable with values -1/1 (for compatibility with SVMlight format). training\_frame Id of the training data frame. model\_id Destination id for this model; auto-generated if not specified. validation\_frame Id of the validation data frame. ignore\_const\_cols Logical. Ignore constant columns. Defaults to TRUE. Penalty parameter C of the error term Defaults to 1. hyper\_param

h2o.psvm 231

kernel\_type Type of used kernel Must be one of: "gaussian". Defaults to gaussian.

gamma Coefficient of the kernel (currently RBF gamma for gaussian kernel, -1 means

1/#features) Defaults to -1.

rank\_ratio Desired rank of the ICF matrix expressed as an ration of number of input rows

(-1 means use sqrt(#rows)). Defaults to -1.

positive\_weight

Weight of positive (+1) class of observations Defaults to 1.

negative\_weight

Weight of positive (-1) class of observations Defaults to 1.

disable\_training\_metrics

Logical. Disable calculating training metrics (expensive on large datasets) De-

faults to TRUE.

sv\_threshold Threshold for accepting a candidate observation into the set of support vectors

Defaults to 0.0001.

fact\_threshold Convergence threshold of the Incomplete Cholesky Factorization (ICF) Defaults

to 1e-05.

feasible\_threshold

Convergence threshold for primal-dual residuals in the IPM iteration Defaults to

0.001.

surrogate\_gap\_threshold

Feasibility criterion of the surrogate duality gap (eta) Defaults to 0.001.

mu\_factor Increasing factor mu Defaults to 10.

max\_iterations Maximum number of iteration of the algorithm Defaults to 200.

seed Seed for random numbers (affects certain parts of the algo that are stochastic

and those might or might not be enabled by default). Defaults to -1 (time-based

random number).

232 h2o.quantile

h2o.quantile

Quantiles of H2O Frames.

## **Description**

Obtain and display quantiles for H2O parsed data.

### Usage

```
h2o.quantile(
    x,
    probs = c(0.001, 0.01, 0.1, 0.25, 0.333, 0.5, 0.667, 0.75, 0.9, 0.99, 0.999),
    combine_method = c("interpolate", "average", "avg", "low", "high"),
    weights_column = NULL,
    ...
)

## S3 method for class 'H2OFrame'
quantile(
    x,
    probs = c(0.001, 0.01, 0.1, 0.25, 0.333, 0.5, 0.667, 0.75, 0.9, 0.99, 0.999),
    combine_method = c("interpolate", "average", "avg", "low", "high"),
    weights_column = NULL,
    ...
)
```

### **Arguments**

An H20Frame object with a single numeric column.

Numeric vector of probabilities with values in [0,1].

combine\_method How to combine quantiles for even sample sizes. Default is to do linear interpolation. E.g., If method is "lo", then it will take the lo value of the quantile. Abbreviations for average, low, and high are acceptable (avg, lo, hi).

weights\_column (Optional) String name of the observation weights column in x or an H20Frame object with a single numeric column of observation weights.

Further arguments passed to or from other methods.

#### **Details**

quantile.H20Frame, a method for the quantile generic. Obtain and return quantiles for an H20Frame object.

#### Value

A vector describing the percentiles at the given cutoffs for the H20Frame object.

h2o.r2

### **Examples**

```
## Not run:
# Request quantiles for an H2O parsed data set:
library(h2o)
h2o.init()
prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.uploadFile(path = prostate_path)
# Request quantiles for a subset of columns in an H2O parsed data set
quantile(prostate[,3])
for(i in 1:ncol(prostate))
    quantile(prostate[, i])
## End(Not run)</pre>
```

h2o.r2

Retrieve the R2 value

### **Description**

Retrieves the R2 value from an H2O model. Will return R^2 for GLM Models and will return NaN otherwise. If "train", "valid", and "xval" parameters are FALSE (default), then the training R2 value is returned. If more than one parameter is set to TRUE, then a named vector of R2s are returned, where the names are "train", "valid" or "xval".

#### Usage

```
h2o.r2(object, train = FALSE, valid = FALSE, xval = FALSE)
```

### **Arguments**

object An H2OModel object. train Retrieve the training R2

valid Retrieve the validation set R2 if a validation set was passed in during model

build time.

xval Retrieve the cross-validation R2

```
## Not run:
library(h2o)
h <- h2o.init()
fr <- as.h2o(iris)

m <- h2o.glm(x = 2:5, y = 1, training_frame = fr)
h2o.r2(m)
## End(Not run)</pre>
```

h2o.randomForest

Build a Random Forest model

## **Description**

Builds a Random Forest model on an H2OFrame.

## Usage

```
h2o.randomForest(
  х,
 у,
  training_frame,
 model_id = NULL,
  validation_frame = NULL,
  nfolds = 0,
  keep_cross_validation_models = TRUE,
  keep_cross_validation_predictions = FALSE,
  keep_cross_validation_fold_assignment = FALSE,
  score_each_iteration = FALSE,
  score_tree_interval = 0,
  fold_assignment = c("AUTO", "Random", "Modulo", "Stratified"),
  fold_column = NULL,
  ignore_const_cols = TRUE,
  offset_column = NULL,
  weights_column = NULL,
  balance_classes = FALSE,
  class_sampling_factors = NULL,
  max_after_balance_size = 5,
 max_hit_ratio_k = 0,
  ntrees = 50,
 max_depth = 20,
 min_rows = 1,
  nbins = 20,
  nbins_top_level = 1024,
  nbins_cats = 1024,
  r2_stopping = Inf,
  stopping\_rounds = 0,
 stopping_metric = c("AUTO", "deviance", "logloss", "MSE", "RMSE", "MAE", "RMSLE",
  "AUC", "AUCPR", "lift_top_group", "misclassification", "mean_per_class_error",
    "custom", "custom_increasing"),
  stopping_tolerance = 0.001,
  max_runtime_secs = 0,
  seed = -1,
  build_tree_one_node = FALSE,
  mtries = -1,
  sample_rate = 0.632,
```

```
sample_rate_per_class = NULL,
      binomial_double_trees = FALSE,
      checkpoint = NULL,
      col_sample_rate_change_per_level = 1,
      col_sample_rate_per_tree = 1,
      min_split_improvement = 1e-05,
      histogram_type = c("AUTO", "UniformAdaptive", "Random", "QuantilesGlobal",
        "RoundRobin"),
     categorical_encoding = c("AUTO", "Enum", "OneHotInternal", "OneHotExplicit", "Binary",
        "Eigen", "LabelEncoder", "SortByResponse", "EnumLimited"),
      calibrate_model = FALSE,
      calibration_frame = NULL,
     distribution = c("AUTO", "bernoulli", "multinomial", "gaussian", "poisson", "gamma",
        "tweedie", "laplace", "quantile", "huber"),
      custom_metric_func = NULL,
      export_checkpoints_dir = NULL,
      check_constant_response = TRUE,
      verbose = FALSE
    )
Arguments
                     (Optional) A vector containing the names or indices of the predictor variables to
    Х
                     use in building the model. If x is missing, then all columns except y are used.
                     The name or column index of the response variable in the data. The response
    У
                     must be either a numeric or a categorical/factor variable. If the response is
                     numeric, then a regression model will be trained, otherwise it will train a classi-
                     fication model.
    training_frame Id of the training data frame.
    model_id
                     Destination id for this model; auto-generated if not specified.
    validation frame
                     Id of the validation data frame.
    nfolds
                     Number of folds for K-fold cross-validation (0 to disable or \geq 2). Defaults to
    keep_cross_validation_models
                     Logical. Whether to keep the cross-validation models. Defaults to TRUE.
    keep_cross_validation_predictions
                     Logical. Whether to keep the predictions of the cross-validation models. De-
                     faults to FALSE.
    keep_cross_validation_fold_assignment
                     Logical. Whether to keep the cross-validation fold assignment. Defaults to
                     FALSE.
    score_each_iteration
                     Logical. Whether to score during each iteration of model training. Defaults to
                     FALSE.
```

Score the model after every so many trees. Disabled if set to 0. Defaults to 0.

score\_tree\_interval

fold\_assignment

Cross-validation fold assignment scheme, if fold\_column is not specified. The 'Stratified' option will stratify the folds based on the response variable, for classification problems. Must be one of: "AUTO", "Random", "Modulo", "Stratified". Defaults to AUTO.

fold\_column Column with cross-validation fold index assignment per observation.

ignore\_const\_cols

Logical. Ignore constant columns. Defaults to TRUE.

offset\_column Offset column. This argument is deprecated and has no use for Random Forest.

weights\_column Column with observation weights. Giving some observation a weight of zero is equivalent to excluding it from the dataset; giving an observation a relative weight of 2 is equivalent to repeating that row twice. Negative weights are not allowed. Note: Weights are per-row observation weights and do not increase the

size of the data frame. This is typically the number of times a row is repeated, but non-integer values are supported as well. During training, rows with higher weights matter more, due to the larger loss function pre-factor.

balance\_classes

Logical. Balance training data class counts via over/under-sampling (for imbalanced data). Defaults to FALSE.

class\_sampling\_factors

Desired over/under-sampling ratios per class (in lexicographic order). If not specified, sampling factors will be automatically computed to obtain class balance during training. Requires balance\_classes.

max\_after\_balance\_size

Maximum relative size of the training data after balancing class counts (can be less than 1.0). Requires balance\_classes. Defaults to 5.0.

max\_hit\_ratio\_k

Max. number (top K) of predictions to use for hit ratio computation (for multiclass only, 0 to disable) Defaults to 0.

ntrees Number of trees. Defaults to 50.

max\_depth Maximum tree depth. Defaults to 20.

min\_rows Fewest allowed (weighted) observations in a leaf. Defaults to 1.

nbins For numerical columns (real/int), build a histogram of (at least) this many bins,

then split at the best point Defaults to 20.

nbins\_top\_level

For numerical columns (real/int), build a histogram of (at most) this many bins at the root level, then decrease by factor of two per level Defaults to 1024.

nbins\_cats For categorical columns (factors), build a histogram of this many bins, then split at the best point. Higher values can lead to more overfitting. Defaults to 1024.

r2\_stopping is no longer supported and will be ignored if set - please use stopping\_rounds, stopping\_metric and stopping\_tolerance instead. Previous version of H2O would stop making trees when the R^2 metric equals or exceeds this

Defaults to 1.797693135e+308.

#### stopping\_rounds

Early stopping based on convergence of stopping\_metric. Stop if simple moving average of length k of the stopping\_metric does not improve for k:=stopping\_rounds scoring events (0 to disable) Defaults to 0.

### stopping\_metric

Metric to use for early stopping (AUTO: logloss for classification, deviance for regression and anonomaly\_score for Isolation Forest). Note that custom and custom\_increasing can only be used in GBM and DRF with the Python client. Must be one of: "AUTO", "deviance", "logloss", "MSE", "RMSE", "MAE", "RMSLE", "AUCPR", "lift\_top\_group", "misclassification", "mean\_per\_class\_error", "custom", "custom\_increasing". Defaults to AUTO.

#### stopping\_tolerance

Relative tolerance for metric-based stopping criterion (stop if relative improvement is not at least this much) Defaults to 0.001.

#### max\_runtime\_secs

Maximum allowed runtime in seconds for model training. Use 0 to disable. Defaults to 0.

seed

Seed for random numbers (affects certain parts of the algo that are stochastic and those might or might not be enabled by default). Defaults to -1 (time-based random number).

### build\_tree\_one\_node

Logical. Run on one node only; no network overhead but fewer cpus used. Suitable for small datasets. Defaults to FALSE.

mtries

Number of variables randomly sampled as candidates at each split. If set to -1, defaults to sqrtp for classification and p/3 for regression (where p is the # of predictors Defaults to -1.

sample\_rate Row sample rate per tree (from 0.0 to 1.0) Defaults to 0.632.

#### sample\_rate\_per\_class

A list of row sample rates per class (relative fraction for each class, from 0.0 to 1.0), for each tree

## binomial\_double\_trees

Logical. For binary classification: Build 2x as many trees (one per class) - can lead to higher accuracy. Defaults to FALSE.

checkpoint Model checkpoint to resume training with.

### col\_sample\_rate\_change\_per\_level

Relative change of the column sampling rate for every level (must be > 0.0 and <= 2.0) Defaults to 1.

#### col\_sample\_rate\_per\_tree

Column sample rate per tree (from 0.0 to 1.0) Defaults to 1.

#### min\_split\_improvement

Minimum relative improvement in squared error reduction for a split to happen Defaults to 1e-05.

histogram\_type What type of histogram to use for finding optimal split points Must be one of: "AUTO", "UniformAdaptive", "Random", "QuantilesGlobal", "RoundRobin". Defaults to AUTO.

categorical\_encoding

Encoding scheme for categorical features Must be one of: "AUTO", "Enum", "OneHotInternal", "OneHotExplicit", "Binary", "Eigen", "LabelEncoder", "Sort-ByResponse", "EnumLimited". Defaults to AUTO.

calibrate\_model

Logical. Use Platt Scaling to calculate calibrated class probabilities. Calibration can provide more accurate estimates of class probabilities. Defaults to FALSE.

calibration\_frame

Calibration frame for Platt Scaling

distribution Distribution. This argument is deprecated and has no use for Random Forest. custom\_metric\_func

Reference to custom evaluation function, format: 'language:keyName=funcName' export\_checkpoints\_dir

Automatically export generated models to this directory.

check\_constant\_response

Logical. Check if response column is constant. If enabled, then an exception is thrown if the response column is a constant value. If disabled, then model will train regardless of the response column being a constant value or not. Defaults to TRUE.

verbose

Logical. Print scoring history to the console (Metrics per tree). Defaults to FALSE.

### Value

Creates a H2OModel object of the right type.

f <- "http://h2o-public-test-data.s3.amazonaws.com/smalldata/iris/iris_train.csv"
iris <- h2o.importFile(f)
h2o.range(iris["petal_len"], na.rm = TRUE, finite = TRUE)
## End(Not run)</pre>
```

h2o.rank\_within\_group\_by

This function will add a new column rank where the ranking is produced as follows: 1. sorts the H2OFrame by columns sorted in by columns specified in group\_by\_cols and sort\_cols in the directions specified by the ascending for the sort\_cols. The sort directions for the group\_by\_cols are ascending only. 2. A new rank column is added to the frame which will contain a rank assignment performed next. The user can choose to assign a name to this new column. The default name is New\_Rank\_column. 3. For each groupby groups, a rank is assigned to the row starting from 1, 2, ... to the end of that group. 4. If sort\_cols\_sorted is TRUE, a final sort on the frame will be performed frame according to the sort\_cols and the sort directions in ascending. If sort\_cols\_sorted is FALSE (by default), the frame from step 3 will be returned as is with no extra sort. This may provide a small speedup if desired.

### **Description**

This function will add a new column rank where the ranking is produced as follows: 1. sorts the H2OFrame by columns sorted in by columns specified in group\_by\_cols and sort\_cols in the directions specified by the ascending for the sort\_cols. The sort directions for the group\_by\_cols are ascending only. 2. A new rank column is added to the frame which will contain a rank assignment performed next. The user can choose to assign a name to this new column. The default name is New\_Rank\_column. 3. For each groupby groups, a rank is assigned to the row starting from 1, 2, ... to the end of that group. 4. If sort\_cols\_sorted is TRUE, a final sort on the frame will be performed frame according to the sort\_cols and the sort directions in ascending. If sort\_cols\_sorted is FALSE (by default), the frame from step 3 will be returned as is with no extra sort. This may provide a small speedup if desired.

#### **Usage**

```
h2o.rank_within_group_by(
    x,
    group_by_cols,
    sort_cols,
    ascending = NULL,
    new_col_name = "New_Rank_column",
    sort_cols_sorted = FALSE
)
```

### **Arguments**

```
x The H2OFrame input to be sorted.
group_by_cols a list of column names or indices to form the groupby groups
sort_cols a list of column names or indices for sorting
```

ascending

a list of Boolean to determine if ascending sort (set to TRUE) is needed for each column in sort\_cols (optional). Default is ascending sort for all. To perform descending sort, set value to FALSE

new\_col\_name

new column name for the newly added rank column if specified (optional). Default name is New\_Rank\_column.

sort\_cols\_sorted

Boolean to determine if the final returned frame is to be sorted according to the sort\_cols and sort directions in ascending. Default is FALSE.

The following example is generated by Nidhi Mehta.

If the input frame is train:

ID Group\_by\_column num data Column\_to\_arrange\_by num\_1 fdata 12 1 2941.552 1 3 -3177.9077 1 12 1 2941.552 1 5 -13311.8247 1 12 2 -22722.174 1 3 - 3177.9077 1 12 2 -22722.174 1 5 -13311.8247 1 13 3 -12776.884 1 5 -18421.6171 0 13 3 -12776.884 1 4 28080.1607 0 13 1 -6049.830 1 5 -18421.6171 0 13 1 -6049.830 1 4 28080.1607 0 15 3 -16995.346 1 1 -9781.6373 0 16 1 -10003.593 0 3 -61284.6900 0 16 3 26052.495 1 3 -61284.6900 0 16 3 -22905.288 0 3 -61284.6900 0 17 2 -13465.496 1 2 12094.4851 1 17 2 -13465.496 1 3 -11772.1338 1 17 2 -13465.496 1 3 -11772.1338 1 17 2 -3329.619 1 3 -11772.1338 1 17 2 -3329.619 1 3 -415.1114 0

If the following commands are issued: rankedF1 <- h2o.rank\_within\_group\_by(train, c("Group\_by\_column"), c("Column\_to\_arrange\_by"), c(TRUE)) h2o.summary(rankedF1)

The returned frame rankedF1 will look like this: ID Group\_by\_column num fdata Column\_to\_arrange\_by num\_1 fdata.1 New\_Rank\_column 12 1 2941.552 1 3 -3177.9077 1 1 16 1 -10003.593 0 3 -61284.6900 0 2 13 1 -6049.830 0 4 28080.1607 0 3 12 1 2941.552 1 5 -13311.8247 1 4 13 1 -6049.830 0 5 -18421.6171 0 5 17 2 -13465.496 0 2 12094.4851 1 1 17 2 -3329.619 0 2 12094.4851 1 2 12 2 -22722.174 1 3 -3177.9077 1 3 17 2 -13465.496 0 3 -11772.1338 1 4 17 2 -13465.496 0 3 -415.1114 0 5 17 2 -3329.619 0 3 -11772.1338 1 6 17 2 -3329.619 0 3 -415.1114 0 7 12 2 -22722.174 1 5 -13311.8247 1 8 15 3 -16995.346 1 1 -9781.6373 0 1 16 3 26052.495 0 3 -61284.6900 0 2 16 3 -22905.288 1 3 -61284.6900 0 3 13 3 -12776.884 1 4 28080.1607 0 4 13 3 -12776.884 1 5 -18421.6171 0 5

If the following commands are issued: rankedF1 <- h2o.rank\_within\_group\_by(train, c("Group\_by\_column"), c("Column\_to\_arrange\_by"), c(TRUE), sort\_cols\_sorted=TRUE) h2o.summary(rankedF1)

The returned frame will be sorted according to sortCols and hence look like this instead: ID Group\_by\_column num fdata Column\_to\_arrange\_by num\_1 fdata.1 New\_Rank\_column 15 3 -16995.346 1 1 -9781.6373 0 1 17 2 -13465.496 0 2 12094.4851 1 1 17 2 -3329.619 0 2 12094.4851 1 2 12 1 2941.552 1 3 -3177.9077 1 1 12 2 -22722.174 1 3 -3177.9077 1 3 16 1 -10003.593 0 3 -61284.6900 0 2 16 3 26052.495 0 3 -61284.6900 0 2 16 3 -22905.288 1 3 -61284.6900 0 3 17 2 -13465.496 0 3 -11772.1338 1 4 17 2 -13465.496 0 3 -415.1114 0 5 17 2 -3329.619 0 3 -11772.1338 1 6 17 2 -3329.619 0 3 -415.1114 0 7 13 3 -12776.884 1 4 28080.1607 0 4 13 1 -6049.830 0 4 28080.1607 0 3 12 1 2941.552 1 5 -13311.8247 1 4 12 2 -22722.174 1 5 -13311.8247 1 8 13 3 -12776.884 1 5 -18421.6171 0 5 13 1 -6049.830 0 5 -18421.6171 0 5

242 h2o.rbind

### **Examples**

h2o.rbind

Combine H2O Datasets by Rows

### **Description**

Takes a sequence of H2O data sets and combines them by rows

### Usage

```
h2o.rbind(...)
```

## **Arguments**

A sequence of H2OFrame arguments. All datasets must exist on the same H2O instance (IP and port) and contain the same number and types of columns.

#### Value

An H2OFrame object containing the combined . . . arguments row-wise.

#### See Also

rbind for the base R method.

```
## Not run:
library(h2o)
h2o.init()
prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.uploadFile(path = prostate_path)</pre>
```

h2o.reconstruct 243

```
prostate_rbind <- h2o.rbind(prostate, prostate)
head(prostate_rbind)
dim(prostate)
dim(prostate_rbind)
## End(Not run)</pre>
```

h2o.reconstruct

Reconstruct Training Data via H2O GLRM Model

### **Description**

Reconstruct the training data and impute missing values from the H2O GLRM model by computing the matrix product of X and Y, and transforming back to the original feature space by minimizing each column's loss function.

### Usage

```
h2o.reconstruct(object, data, reverse_transform = FALSE)
```

### **Arguments**

object An H2ODimReductionModel object that represents the model to be used for

reconstruction.

data An H2OFrame object representing the training data for the H2O GLRM model.

Used to set the domain of each column in the reconstructed frame.

reverse\_transform

(Optional) A logical value indicating whether to reverse the transformation from model-building by re-scaling columns and adding back the offset to each column

of the reconstructed frame.

#### Value

Returns an H2OFrame object containing the approximate reconstruction of the training data;

## See Also

h2o.glrm for making an H2ODimReductionModel.

244 h2o.relevel

```
## End(Not run)
```

h2o.relevel

Reorders levels of an H2O factor, similarly to standard R's relevel.

# Description

The levels of a factor are reordered os that the reference level is at level 0, remaining levels are moved down as needed.

# Usage

```
h2o.relevel(x, y)
```

# Arguments

x factor column in h2o frame

y reference level (string)

## Value

new reordered factor column

```
## Not run:
library(h2o)
h2o.init()

# Convert iris dataset to an H20Frame
iris_hf <- as.h2o(iris)
# Look at current ordering of the Species column levels
h2o.levels(iris_hf["Species"])
# "setosa" "versicolor" "virginica"
# Change the reference level to "virginica"
iris_hf["Species"] <- h2o.relevel(x = iris_hf["Species"], y = "virginica")
# Observe new ordering
h2o.levels(iris_hf["Species"])
# "virginica" "setosa" "versicolor"

## End(Not run)</pre>
```

h2o.removeAll 245

h2o.removeAll

Remove All Objects on the H2O Cluster

## **Description**

Removes the data from the h2o cluster, but does not remove the local references. Retains frames and vectors specified in retained\_elements argument. Retained keys must be keys of models and frames only. For models retained, training and validation frames are retained as well. Cross validation models of a retained model are NOT retained automatically, those must be specified explicitly.

## Usage

```
h2o.removeAll(timeout_secs = 0, retained_elements = c())
```

### **Arguments**

```
timeout_secs Timeout in seconds. Default is no timeout. retained_elements
```

Frames and vectors to be retained. Other keys provided are ignored.

#### See Also

```
h2o.rm
```

#### **Examples**

```
## Not run:
library(h2o)
h2o.init()
prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.uploadFile(path = prostate_path)
h2o.ls()
h2o.removeAll()
h2o.ls()
## End(Not run)</pre>
```

h2o.removeVecs

Delete Columns from an H2OFrame

### **Description**

Delete the specified columns from the H2OFrame. Returns an H2OFrame without the specified columns.

246 h2o.rep\_len

## Usage

```
h2o.removeVecs(data, cols)
```

### **Arguments**

data The H2OFrame.

cols The columns to remove.

h2o.rep\_len

Replicate Elements of Vectors or Lists into H2O

## **Description**

h2o.rep\_len performs just as rep does. It replicates the values in x in the H2O backend.

# Usage

```
h2o.rep_len(x, length.out)
```

## Arguments

x an H2O frame

length.out non negative integer. The desired length of the output vector.

## Value

Creates an H2OFrame of the same type as x

```
## Not run:
library(h2o)
h2o.init()

f <- "http://h2o-public-test-data.s3.amazonaws.com/smalldata/iris/iris_train.csv"
iris <- h2o.importFile(f)
h2o.rep_len(iris, length.out = 3)

## End(Not run)</pre>
```

h2o.residual\_deviance 247

```
h2o.residual_deviance Retrieve the residual deviance
```

### **Description**

If "train", "valid", and "xval" parameters are FALSE (default), then the training residual deviance value is returned. If more than one parameter is set to TRUE, then a named vector of residual deviances are returned, where the names are "train", "valid" or "xval".

#### **Usage**

```
h2o.residual_deviance(object, train = FALSE, valid = FALSE, xval = FALSE)
```

## **Arguments**

object	An H2OModel or H2OModelMetrics
train	Retrieve the training residual deviance
valid	Retrieve the validation residual deviance
xval	Retrieve the cross-validation residual deviance

### **Examples**

h2o.residual\_dof

Retrieve the residual degrees of freedom

### **Description**

If "train", "valid", and "xval" parameters are FALSE (default), then the training residual degrees of freedom value is returned. If more than one parameter is set to TRUE, then a named vector of residual degrees of freedom are returned, where the names are "train", "valid" or "xval".

248 h2o.rm

### Usage

```
h2o.residual_dof(object, train = FALSE, valid = FALSE, xval = FALSE)
```

### **Arguments**

object An H2OModel or H2OModelMetrics
train Retrieve the training residual degrees of freedom
valid Retrieve the validation residual degrees of freedom
xval Retrieve the cross-validation residual degrees of freedom

### **Examples**

h2o.rm

Delete Objects In H2O

#### **Description**

Remove the h2o Big Data object(s) having the key name(s) from ids.

## Usage

```
h2o.rm(ids, cascade = TRUE)
```

### **Arguments**

ids The object or hex key associated with the object to be removed or a vector/list

of those things.

cascade Boolean, if set to TRUE (default), the object dependencies (e.g. submodels) are

also removed.

### See Also

```
h2o.assign, h2o.ls
```

h2o.rmse 249

### **Examples**

```
## Not run:
library(h2o)
h2o.init()
iris_hex <- as.h2o(iris)
model <- h2o.glm(1:4,5,training = iris_hex, family = "multinomial")
h2o.rm(iris_hex)
## End(Not run)</pre>
```

h2o.rmse

Retrieves Root Mean Squared Error Value

## **Description**

Retrieves the root mean squared error value from an H2OModelMetrics object. If "train", "valid", and "xval" parameters are FALSE (default), then the training RMSEvalue is returned. If more than one parameter is set to TRUE, then a named vector of RMSEs are returned, where the names are "train", "valid" or "xval".

## Usage

```
h2o.rmse(object, train = FALSE, valid = FALSE, xval = FALSE)
```

## **Arguments**

object An H2OModelMetrics object of the correct type.

train Retrieve the training RMSE

valid Retrieve the validation RMSE

xval Retrieve the cross-validation RMSE

### **Details**

This function only supports H2OBinomialMetrics, H2OMultinomialMetrics, and H2ORegressionMetrics objects.

#### See Also

h2o.auc for AUC, h2o.mse for RMSE, and h2o.metric for the various threshold metrics. See h2o.performance for creating H2OModelMetrics objects.

250 h2o.rmsle

### **Examples**

```
## Not run:
library(h2o)
h2o.init()

prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.uploadFile(prostate_path)

prostate[,2] <- as.factor(prostate[,2])
model <- h2o.gbm(x = 3:9, y = 2, training_frame = prostate, distribution = "bernoulli")
perf <- h2o.performance(model, prostate)
h2o.rmse(perf)

## End(Not run)</pre>
```

h2o.rmsle

Retrieve the Root Mean Squared Log Error

# Description

Retrieves the root mean squared log error (RMSLE) value from an H2O model. If "train", "valid", and "xval" parameters are FALSE (default), then the training rmsle value is returned. If more than one parameter is set to TRUE, then a named vector of rmsles are returned, where the names are "train", "valid" or "xval".

# Usage

```
h2o.rmsle(object, train = FALSE, valid = FALSE, xval = FALSE)
```

## **Arguments**

object An H2OModel object. train Retrieve the training rmsle

valid Retrieve the validation set rmsle if a validation set was passed in during model

build time.

xval Retrieve the cross-validation rmsle

```
## Not run:
library(h2o)
h <- h2o.init()
fr <- as.h2o(iris)

m <- h2o.deeplearning(x = 2:5, y = 1, training_frame = fr)
h2o.rmsle(m)</pre>
```

h2o.round 251

```
## End(Not run)
```

h2o.round

Round doubles/floats to the given number of decimal places.

## **Description**

Round doubles/floats to the given number of decimal places.

# Usage

```
h2o.round(x, digits = 0)
round(x, digits = 0)
```

# Arguments

x An H2OFrame object.

digits Number of decimal places to round doubles/floats. Rounding to a negative num-

ber of decimal places is

# See Also

round for the base R implementation.

```
## Not run:
library(h2o)
h2o.init()

f <- "http://s3.amazonaws.com/h2o-public-test-data/smalldata/coxph_test/heart.csv"
heart <- h2o.importFile(f)

h2o.round(heart["age"], digits = 3)

## End(Not run)</pre>
```

252 h2o.runif

h2o.rstrip

Strip set from right

## **Description**

Return a copy of the target column with trailing characters removed. The set argument is a string specifying the set of characters to be removed. If omitted, the set argument defaults to removing whitespace.

## Usage

```
h2o.rstrip(x, set = "")
```

## **Arguments**

x The column whose strings should be rstrip-ed.

set string of characters to be removed

## **Examples**

```
## Not run:
library(h2o)
h2o.init()
string_to_rstrip <- as.h2o("1234567890")
rstrip_string <- h2o.rstrip(string_to_rstrip, "890") #Remove "890"
## End(Not run)</pre>
```

h2o.runif

Produce a Vector of Random Uniform Numbers

## **Description**

Creates a vector of random uniform numbers equal in length to the length of the specified H2O dataset.

## Usage

```
h2o.runif(x, seed = -1)
```

### **Arguments**

x An H2OFrame object.

seed A random seed used to generate draws from the uniform distribution.

h2o.saveGrid 253

#### Value

A vector of random, uniformly distributed numbers. The elements are between 0 and 1.

### **Examples**

```
## Not run:
library(h2o)
h2o.init()
prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.importFile(path = prostate_path)
s <- h2o.runif(prostate)
summary(s)

prostate_train <- prostate[s <= 0.8,]
prostate_test <- prostate[s > 0.8,]
nrow(prostate_train) + nrow(prostate_test)
## End(Not run)
```

h2o.saveGrid

Saves an existing Grid of models into a given folder.

# Description

Returns a reference to the saved Grid.

# Usage

```
h2o.saveGrid(grid_directory, grid_id)
```

#### **Arguments**

```
grid_directory A character string containing the path to the folder for the grid to be saved to.
grid_id A character string with identification of the grid to be saved.
```

## Value

Returns an object that is a subclass of H2OGrid.

```
## Not run:
library(h2o)
h2o.init()

iris.hex <- as.h2o(iris)

ntrees_opts = c(1, 5)
learn_rate_opts = c(0.1, 0.01)</pre>
```

254 h2o.saveModel

```
size_of_hyper_space = length(ntrees_opts) * length(learn_rate_opts)

hyper_parameters = list(ntrees = ntrees_opts, learn_rate = learn_rate_opts)

# Tempdir is chosen arbitrarily. May be any valid folder on an H2O-supported filesystem.
baseline_grid <- h2o.grid("gbm", grid_id="gbm_grid_test", x=1:4, y=5, training_frame=iris.hex,
hyper_params = hyper_parameters)

grid_path <- h2o.saveGrid(grid_directory = tempdir(), grid_id = baseline_grid@grid_id)

# Remove everything from the cluster or restart it
h2o.removeAll()
grid <- h2o.loadGrid(grid_path)

## End(Not run)</pre>
```

h2o.saveModel

Save an H2O Model Object to Disk

### Description

Save an H2OModel to disk. (Note that ensemble binary models can be saved.)

#### Usage

```
h2o.saveModel(object, path = "", force = FALSE)
```

#### Arguments

object an H2OModel object.

path string indicating the directory the model will be written to. force logical, indicates how to deal with files that already exist.

#### **Details**

In the case of existing files force = TRUE will overwrite the file. Otherwise, the operation will fail. The owner of the file saved is the user by which H2O cluster was executed.

#### See Also

h2o.loadModel for loading a model to H2O from disk

```
## Not run:
# library(h2o)
# h2o.init()
# prostate <- h2o.importFile(path = paste("https://raw.github.com",
# "h2oai/h2o-2/master/smalldata/logreg/prostate.csv", sep = "/"))
# prostate_glm <- h2o.glm(y = "CAPSULE", x = c("AGE", "RACE", "PSA", "DCAPS"),</pre>
```

h2o.saveModelDetails 255

```
# training_frame = prostate, family = "binomial", alpha = 0.5)
# h2o.saveModel(object = prostate_glm, path = "/Users/UserName/Desktop", force = TRUE)
## End(Not run)
```

h2o.saveModelDetails Save an H2O Model Details

#### **Description**

Save Model Details of an H2O Model in JSON Format

## Usage

```
h2o.saveModelDetails(object, path = "", force = FALSE)
```

## **Arguments**

object an H2OModel object.

path string indicating the directory the model details will be written to.

force logical, indicates how to deal with files that already exist.

## **Details**

Model Details will download as a JSON file. In the case of existing files force = TRUE will overwrite the file. Otherwise, the operation will fail.

```
## Not run:
# library(h2o)
# h2o.init()
# prostate <- h2o.uploadFile(path = system.file("extdata", "prostate.csv", package = "h2o"))
# prostate_glm <- h2o.glm(y = "CAPSULE", x = c("AGE", "RACE", "PSA", "DCAPS"),
# training_frame = prostate, family = "binomial", alpha = 0.5)
# h2o.saveModelDetails(object = prostate_glm, path = "/Users/UserName/Desktop", force = TRUE)
## End(Not run)</pre>
```

256 h2o.saveMojo

h2o.saveMojo

Save an H2O Model Object as Mojo to Disk

## **Description**

Save an MOJO (Model Object, Optimized) to disk.

### Usage

```
h2o.saveMojo(object, path = "", force = FALSE)
```

## Arguments

object an H2OModel object.

path string indicating the directory the model will be written to.

force logical, indicates how to deal with files that already exist.

#### **Details**

MOJO will download as a zip file. In the case of existing files force = TRUE will overwrite the file. Otherwise, the operation will fail.

## See Also

h2o.saveModel for saving a model to disk as a binary object.

```
## Not run:
# library(h2o)
# h2o.init()
# prostate <- h2o.uploadFile(path = system.file("extdata", "prostate.csv", package="h2o"))
# prostate_glm <- h2o.glm(y = "CAPSULE", x = c("AGE","RACE","PSA","DCAPS"),
# training_frame = prostate, family = "binomial", alpha = 0.5)
# h2o.saveMojo(object = prostate_glm, path = "/Users/UserName/Desktop", force = TRUE)
## End(Not run)</pre>
```

h2o.scale 257

h2o.scale	Scaling and Centering of an H2OFrame	
-----------	--------------------------------------	--

# Description

Centers and/or scales the columns of an H2O dataset.

# Usage

```
h2o.scale(x, center = TRUE, scale = TRUE, inplace = FALSE)
```

## Arguments

x An H2OFrame object.

center either a logical value or numeric vector of length equal to the number of

columns of x.

scale either a logical value or numeric vector of length equal to the number of

columns of x.

inplace a logical values indicating whether directly overwrite original data (disabled

by default). Exposed for backwards compatibility (prior versions of this func-

tions were always doing an inplace update).

## **Examples**

```
## Not run:
library(h2o)
h2o.init()
iris_hf <- as.h2o(iris)
summary(iris_hf)

# Scale and center all the numeric columns in iris data set
iris_scaled <- h2o.scale(iris_hf[, 1:4])
## End(Not run)</pre>
```

h2o.scoreHistory

Retrieve Model Score History

#### **Description**

Retrieve Model Score History

### Usage

```
h2o.scoreHistory(object)
```

258 h2o.sd

#### **Arguments**

object An H2OModel object.

# **Examples**

```
## Not run:
library(h2o)
h2o.init()
f <- "https://s3.amazonaws.com/h2o-public-test-data/smalldata/junit/cars_20mpg.csv"</pre>
cars <- h2o.importFile(f)</pre>
cars["economy_20mpg"] <- as.factor(cars["economy_20mpg"])</pre>
predictors <- c("displacement", "power", "weight", "acceleration", "year")</pre>
response <- "economy_20mpg"</pre>
cars.split <- h2o.splitFrame(data = cars,ratios = 0.8, seed = 1234)</pre>
train <- cars.split[[1]]</pre>
valid <- cars.split[[2]]</pre>
cars_gbm <- h2o.gbm(x = predictors, y = response,</pre>
                      training_frame = train,
                      validation_frame = valid,
                      seed = 1234)
h2o.scoreHistory(cars_gbm)
## End(Not run)
```

h2o.sd

Standard Deviation of a column of data.

#### **Description**

Obtain the standard deviation of a column of data.

## Usage

```
h2o.sd(x, na.rm = FALSE)
sd(x, na.rm = FALSE)
```

## **Arguments**

```
x An H2OFrame object.na.rm logical. Should missing values be removed?
```

#### See Also

h2o. var for variance, and sd for the base R implementation.

h2o.sdev 259

#### **Examples**

```
## Not run:
library(h2o)
h2o.init()

prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.uploadFile(path = prostate_path)
sd(prostate$AGE)

## End(Not run)</pre>
```

h2o.sdev

Retrieve the standard deviations of principal components

# **Description**

Retrieve the standard deviations of principal components

## Usage

```
h2o.sdev(object)
```

# Arguments

object

An H2ODimReductionModel object.

260 h2o.setTimezone

h2o.setLevels

Set Levels of H2O Factor Column

#### **Description**

Works on a single categorical vector. New domains must be aligned with the old domains. This call has SIDE EFFECTS and mutates the column in place (change of the levels will also affect all the frames that are referencing this column). If you want to make a copy of the column instead, use parameter in place = FALSE.

#### Usage

```
h2o.setLevels(x, levels, in.place = TRUE)
```

## **Arguments**

x A single categorical column.

levels A character vector specifying the new levels. The number of new levels must

match the number of old levels.

in.place Indicates whether new domain will be directly applied to the column (in place

change) or if a copy of the column will be created with the given domain levels.

#### **Examples**

```
## Not run:
library(h2o)
h2o.init()

iris_hf <- as.h2o(iris)
new.levels <- c("setosa", "versicolor", "caroliniana")
iris_hf$Species <- h2o.setLevels(iris_hf$Species, new.levels, in.place = FALSE)
h2o.levels(iris_hf$Species)

## End(Not run)</pre>
```

h2o.setTimezone

Set the Time Zone on the H2O cluster

### **Description**

Set the Time Zone on the H2O cluster

### Usage

```
h2o.setTimezone(tz)
```

h2o.set\_s3\_credentials 261

### **Arguments**

tz

The desired timezone.

#### **Examples**

```
## Not run:
library(h2o)
h2o.init()

h2o.setTimezone("America/Juneau")
h2o.getTimezone()
## End(Not run)
```

h2o.set\_s3\_credentials

Creates a new Amazon S3 client internally with specified credentials.

# Description

There are no validations done to the credentials. Incorrect credentials are thus revealed with first S3 import call.

## Usage

```
h2o.set_s3_credentials(secretKeyId, secretAccessKey, sessionToken = NULL)
```

## **Arguments**

secretKeyId Amazon S3 Secret Key ID (provided by Amazon)

secretAccessKey

Amazon S3 Secret Access Key (provided by Amazon)

sessionToken Amazon Session Token (optional, only when using AWS Temporary Creden-

tials)

h2o.show\_progress

Enable Progress Bar

## **Description**

Enable Progress Bar

## Usage

```
h2o.show_progress()
```

262 h2o.shutdown

#### **Examples**

```
## Not run:
library(h2o)
h2o.init()
h2o.no_progress()
f <- "http://h2o-public-test-data.s3.amazonaws.com/smalldata/iris/iris_wheader.csv"
iris <- h2o.importFile(f)</pre>
iris["class"] <- as.factor(iris["class"])</pre>
predictors <- c("sepal_len", "sepal_wid", "petal_len", "petal_wid")</pre>
splits <- h2o.splitFrame(iris, ratios = 0.8, seed = 1234)</pre>
train <- splits[[1]]</pre>
valid <- splits[[2]]</pre>
h2o.show_progress()
iris_km <- h2o.kmeans(x = predictors,</pre>
                        training_frame = train,
                        validation_frame = valid,
                        k = 10, estimate_k = TRUE,
                        standardize = FALSE, seed = 1234)
## End(Not run)
```

h2o.shutdown

Shut Down H2O Instance

## **Description**

Shut down the specified instance. All data will be lost.

#### Usage

```
h2o.shutdown(prompt = TRUE)
```

## **Arguments**

prompt

A logical value indicating whether to prompt the user before shutting down the H2O server.

## Details

This method checks if H2O is running at the specified IP address and port, and if it is, shuts down that H2O instance.

## WARNING

All data, models, and other values stored on the server will be lost! Only call this function if you and all other clients connected to the H2O server are finished and have saved your work.

h2o.signif 263

## Note

Users must call h2o.shutdown explicitly in order to shut down the local H2O instance started by R. If R is closed before H2O, then an attempt will be made to automatically shut down H2O. This only applies to local instances started with h2o.init, not remote H2O servers.

#### See Also

```
h2o.init
```

# **Examples**

```
# Don't run automatically to prevent accidentally shutting down a cluster
## Not run:
library(h2o)
h2o.init()
h2o.shutdown()
## End(Not run)
```

h2o.signif

Round doubles/floats to the given number of significant digits.

# Description

Round doubles/floats to the given number of significant digits.

# Usage

```
h2o.signif(x, digits = 6)
signif(x, digits = 6)
```

## **Arguments**

x An H2OFrame object.

digits Number of significant digits to round doubles/floats.

#### See Also

```
signif for the base R implementation.
```

264 h2o.sin

## **Examples**

```
## Not run:
library(h2o)
h2o.init()

f <- "http://s3.amazonaws.com/h2o-public-test-data/smalldata/coxph_test/heart.csv"
heart <- h2o.importFile(f)

h2o.signif(heart["age"], digits = 3)
## End(Not run)</pre>
```

h2o.sin

Compute the sine of x

# Description

Compute the sine of x

## Usage

```
h2o.sin(x)
```

# Arguments

Х

An H2OFrame object.

## See Also

sin for the base R implementation.

h2o.skewness 265

h2o.skewness

Skewness of a column

#### Description

Obtain the skewness of a column of a parsed H2O data object.

## Usage

```
h2o.skewness(x, ..., na.rm = TRUE)
skewness.H2OFrame(x, ..., na.rm = TRUE)
```

## **Arguments**

x An H2OFrame object.

... Further arguments to be passed from or to other methods.

na.rm A logical value indicating whether NA or missing values should be stripped be-

fore the computation.

#### Value

Returns a list containing the skewness for each column (NaN for non-numeric columns).

## **Examples**

```
## Not run:
library(h2o)
h2o.init()

prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.uploadFile(path = prostate_path)
h2o.skewness(prostate$AGE)

## End(Not run)</pre>
```

h2o.splitFrame

Split an H2O Data Set

# Description

Split an existing H2O data set according to user-specified ratios. The number of subsets is always 1 more than the number of given ratios. Note that this does not give an exact split. H2O is designed to be efficient on big data using a probabilistic splitting method rather than an exact split. For example, when specifying a split of 0.75/0.25, H2O will produce a test/train split with an expected value of 0.75/0.25 rather than exactly 0.75/0.25. On small datasets, the sizes of the resulting splits will deviate from the expected value more than on big data, where they will be very close to exact.

266 h2o.sqrt

#### Usage

```
h2o.splitFrame(data, ratios = 0.75, destination_frames, seed = -1)
```

#### **Arguments**

data An H2OFrame object representing the dataste to split.

ratios A numeric value or array indicating the ratio of total rows contained in each

split. Must total up to less than 1.

destination\_frames

An array of frame IDs equal to the number of ratios specified plus one.

seed Random seed.

#### Value

Returns a list of split H2OFrame's

## **Examples**

```
## Not run:
library(h2o)
h2o.init()
iris_hf <- as.h2o(iris)
iris_split <- h2o.splitFrame(iris_hf, ratios = c(0.2, 0.5))
head(iris_split[[1]])
summary(iris_split[[1]])
## End(Not run)</pre>
```

h2o.sqrt

Compute the square root of x

## **Description**

Compute the square root of x

## Usage

```
h2o.sqrt(x)
```

# Arguments

Х

An H2OFrame object.

#### See Also

```
sqrt for the base R implementation.
```

h2o.stackedEnsemble 267

#### **Examples**

h2o.stackedEnsemble

Builds a Stacked Ensemble

## **Description**

Build a stacked ensemble (aka. Super Learner) using the H2O base learning algorithms specified by the user.

## Usage

```
h2o.stackedEnsemble(
  Х,
 у,
  training_frame,
  model_id = NULL,
  validation_frame = NULL,
  blending_frame = NULL,
  base_models = list(),
 metalearner_algorithm = c("AUTO", "deeplearning", "drf", "gbm", "glm", "naivebayes",
    "xgboost"),
 metalearner_nfolds = 0,
 metalearner_fold_assignment = c("AUTO", "Random", "Modulo", "Stratified"),
 metalearner_fold_column = NULL,
 metalearner_params = NULL,
  seed = -1,
  keep_levelone_frame = FALSE,
  export_checkpoints_dir = NULL
)
```

#### **Arguments**

Х

(Optional). A vector containing the names or indices of the predictor variables to use in building the model. If x is missing, then all columns except y are used. Training frame is used only to compute ensemble training metrics.

268 h2o.stackedEnsemble

У

The name or column index of the response variable in the data. The response must be either a numeric or a categorical/factor variable. If the response is numeric, then a regression model will be trained, otherwise it will train a classification model.

training\_frame Id of the training data frame.

model\_id Destination id for this model; auto-generated if not specified.

validation\_frame

Id of the validation data frame.

blending\_frame Frame used to compute the predictions that serve as the training frame for the metalearner (triggers blending mode if provided)

List of models or grids (or their ids) to ensemble/stack together. Grids are expanded to individual models. If not using blending frame, then models must have been cross-validated using nfolds > 1, and folds must be identical across models.

metalearner\_algorithm

Type of algorithm to use as the metalearner. Options include 'AUTO' (GLM with non negative weights; if validation\_frame is present, a lambda search is performed), 'deeplearning' (Deep Learning with default parameters), 'drf' (Random Forest with default parameters), 'gbm' (GBM with default parameters), 'glm' (GLM with default parameters), 'naivebayes' (NaiveBayes with default parameters), or 'xgboost' (if available, XGBoost with default parameters). Must be one of: "AUTO", "deeplearning", "drf", "gbm", "glm", "naivebayes", "xgboost". Defaults to AUTO.

metalearner\_nfolds

Number of folds for K-fold cross-validation of the metalearner algorithm (0 to disable or  $\geq$  2). Defaults to 0.

metalearner\_fold\_assignment

Cross-validation fold assignment scheme for metalearner cross-validation. Defaults to AUTO (which is currently set to Random). The 'Stratified' option will stratify the folds based on the response variable, for classification problems. Must be one of: "AUTO", "Random", "Modulo", "Stratified".

metalearner\_fold\_column

Column with cross-validation fold index assignment per observation for cross-validation of the metalearner.

metalearner\_params

Parameters for metalearner algorithm

seed Seed for random numbers; passed through to the metalearner algorithm. Defaults to -1 (time-based random number).

keep\_levelone\_frame

Logical. Keep level one frame used for metalearner training. Defaults to FALSE.

export\_checkpoints\_dir

Automatically export generated models to this directory.

h2o.stackedEnsemble 269

```
## Not run:

## End(Not run)
```

270 h2o.std\_coef\_plot

h2o.startLogging

Start Writing H2O R Logs

#### **Description**

Begin logging H2o R POST commands and error responses to local disk. Used primarily for debuggin purposes.

### Usage

```
h2o.startLogging(file)
```

#### **Arguments**

file

a character string name for the file, automatically generated

#### See Also

```
h2o.stopLogging,h2o.clearLog,h2o.openLog
```

## **Examples**

```
## Not run:
library(h2o)
h2o.init()
h2o.startLogging()
australia_path = system.file("extdata", "australia.csv", package = "h2o")
australia = h2o.importFile(path = australia_path)
h2o.stopLogging()
## End(Not run)
```

h2o.std\_coef\_plot

Plot Standardized Coefficient Magnitudes

## **Description**

Plot a GLM model's standardized coefficient magnitudes.

## Usage

```
h2o.std_coef_plot(model, num_of_features = NULL)
```

# **Arguments**

```
model A trained generalized linear model num_of_features
```

The number of features to be shown in the plot

h2o.stopLogging 271

#### See Also

h2o.varimp\_plot for variable importances plot of random forest, GBM, deep learning.

### **Examples**

h2o.stopLogging

Stop Writing H2O R Logs

## **Description**

Halt logging of H2O R POST commands and error responses to local disk. Used primarily for debugging purposes.

## Usage

```
h2o.stopLogging()
```

#### See Also

```
h2o.startLogging,h2o.clearLog,h2o.openLog
```

```
## Not run:
library(h2o)
h2o.init()
h2o.startLogging()
australia_path = system.file("extdata", "australia.csv", package = "h2o")
australia = h2o.importFile(path = australia_path)
h2o.stopLogging()
## End(Not run)
```

272 h2o.stringdist

h2o.str

Display the structure of an H2OFrame object

## **Description**

Display the structure of an H2OFrame object

### Usage

```
h2o.str(object, ..., cols = FALSE)
```

## **Arguments**

object An H2OFrame.
... Further arguments to be passed from or to other methods.
cols Print the per-column str for the H2OFrame

## **Examples**

h2o.stringdist

Compute element-wise string distances between two H2OFrames

# Description

Compute element-wise string distances between two H2OFrames. Both frames need to have the same shape (N x M) and only contain string/factor columns. Return a matrix (H2OFrame) of shape N x M.

# Usage

```
h2o.stringdist(
    x,
    y,
    method = c("lv", "lcs", "qgram", "jaccard", "jw", "soundex"),
    compare_empty = TRUE
)
```

h2o.strsplit 273

#### **Arguments**

x An H2OFrame

y A comparison H2OFrame

method A string identifier indicating what string distance measure to use. Must be

one of: "lv" - Levenshtein distance "lcs" - Longest common substring distance "qgram" - q-gram distance "jaccard" - Jaccard distance between q-gram profiles "jw" - Jaro, or Jaro-Winker distance "soundex" - Distance based on soundex

encoding

compare\_empty if set to FALSE, empty strings will be handled as NaNs

#### **Examples**

```
## Not run:
h2o.init()
x <- as.h2o(c("Martha", "Dwayne", "Dixon"))
y <- as.character(as.h2o(c("Marhta", "Duane", "Dicksonx")))
h2o.stringdist(x, y, method = "jw")
## End(Not run)</pre>
```

h2o.strsplit

String Split

## **Description**

String Split

## Usage

```
h2o.strsplit(x, split)
```

# Arguments

x The column whose strings must be split.

split The pattern to split on.

#### Value

An H2OFrame where each column is the outcome of the string split.

```
## Not run:
library(h2o)
h2o.init()
string_to_split <- as.h2o("Split at every character.")
split_string <- h2o.strsplit(string_to_split,"")
## End(Not run)</pre>
```

274 h2o.substring

o.sub String Substitute
-------------------------

## **Description**

Creates a copy of the target column in which each string has the first occurence of the regex pattern replaced with the replacement substring.

### Usage

```
h2o.sub(pattern, replacement, x, ignore.case = FALSE)
```

## **Arguments**

```
pattern The pattern to replace.
replacement The replacement pattern.
x The column on which to operate.
ignore.case Case sensitive or not
```

## **Examples**

```
## Not run:
library(h2o)
h2o.init()
string_to_sub <- as.h2o("r tutorial")
sub_string <- h2o.sub("r ", "H2O ", string_to_sub)
## End(Not run)</pre>
```

h2o.substring

Substring

## **Description**

Returns a copy of the target column that is a substring at the specified start and stop indices, inclusive. If the stop index is not specified, then the substring extends to the end of the original string. If start is longer than the number of characters in the original string, or is greater than stop, an empty string is returned. Negative start is coerced to 0.

#### Usage

```
h2o.substring(x, start, stop = "[]")
h2o.substr(x, start, stop = "[]")
```

h2o.sum 275

## **Arguments**

The column on which to operate.

start The index of the first element to be included in the substring.

stop Optional, The index of the last element to be included in the substring.

## **Examples**

```
## Not run:
library(h2o)
h2o.init()
string_to_substring <- as.h2o("1234567890")
substr <- h2o.substring(string_to_substring, 2) #Get substring from second index onwards
## End(Not run)</pre>
```

h2o.sum

Compute the frame's sum by-column (or by-row).

#### **Description**

Compute the frame's sum by-column (or by-row).

#### Usage

```
h2o.sum(x, na.rm = FALSE, axis = 0, return_frame = FALSE)
```

#### **Arguments**

x An H2OFrame object.

na.rm logical. indicating whether missing values should be removed.

axis An int that indicates whether to do down a column (0) or across a row (1). For

row or column sums, the return\_frame parameter must be TRUE.

return\_frame A boolean that indicates whether to return an H2O frame or one single aggre-

gated value. Default is FALSE.

## See Also

sum for the base R implementation.

276 h2o.summary

#### **Examples**

h2o.summary

Summarizes the columns of an H2OFrame.

## **Description**

A method for the summary generic. Summarizes the columns of an H2O data frame or subset of columns and rows using vector notation (e.g. dataset[row, col]).

### Usage

```
h2o.summary(object, factors = 6L, exact_quantiles = FALSE, ...)
## S3 method for class 'H2OFrame'
summary(object, factors, exact_quantiles, ...)
```

## **Arguments**

object An H2OFrame object.

factors The number of factors to return in the summary. Default is the top 6.

exact\_quantiles

Compute exact quantiles or use approximation. Default is to use approximation.

... Further arguments passed to or from other methods.

#### **Details**

By default it uses approximated version of quantiles computation, however, user can modify this behavior by setting up exact\_quantiles argument to true.

#### Value

A table displaying the minimum, 1st quartile, median, mean, 3rd quartile and maximum for each numeric column, and the levels and category counts of the levels in each categorical column.

h2o.svd 277

#### **Examples**

```
## Not run:
library(h2o)
h2o.init()
prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.importFile(path = prostate_path)
summary(prostate)
summary(prostate$GLEASON)
summary(prostate[,4:6])
summary(prostate, exact_quantiles=TRUE)
## End(Not run)</pre>
```

h2o.svd

Singular value decomposition of an H2O data frame using the power method

# Description

Singular value decomposition of an H2O data frame using the power method

## Usage

```
h2o.svd(
  training_frame,
  destination_key,
 model_id = NULL,
  validation_frame = NULL,
  ignore_const_cols = TRUE,
  score_each_iteration = FALSE,
  transform = c("NONE", "STANDARDIZE", "NORMALIZE", "DEMEAN", "DESCALE"),
  svd_method = c("GramSVD", "Power", "Randomized"),
  nv = 1,
  max_iterations = 1000,
  seed = -1,
  keep_u = TRUE,
  u_name = NULL,
  use_all_factor_levels = TRUE,
 max_runtime_secs = 0,
  export_checkpoints_dir = NULL
)
```

# Arguments

training\_frame Id of the training data frame.

x A vector containing the character names of the predictors in the model.

278 h2o.svd

destination\_key

(Optional) The unique key assigned to the resulting model. Automatically generated if none is provided.

model\_id Destination id for this model; auto-generated if not specified.

validation\_frame

Id of the validation data frame.

ignore\_const\_cols

Logical. Ignore constant columns. Defaults to TRUE.

score\_each\_iteration

Logical. Whether to score during each iteration of model training. Defaults to

FALSE.

transform Transformation of training data Must be one of: "NONE", "STANDARDIZE",

"NORMALIZE", "DEMEAN", "DESCALE". Defaults to NONE.

svd\_method Method for computing SVD (Caution: Randomized is currently experimental

and unstable) Must be one of: "GramSVD", "Power", "Randomized". Defaults

to GramSVD.

nv Number of right singular vectors Defaults to 1.

max\_iterations Maximum iterations Defaults to 1000.

seed Seed for random numbers (affects certain parts of the algo that are stochastic

and those might or might not be enabled by default). Defaults to -1 (time-based

random number).

keep\_u Logical. Save left singular vectors? Defaults to TRUE.

u\_name Frame key to save left singular vectors

use\_all\_factor\_levels

Logical. Whether first factor level is included in each categorical expansion

Defaults to TRUE.

max\_runtime\_secs

Maximum allowed runtime in seconds for model training. Use 0 to disable.

Defaults to 0.

export\_checkpoints\_dir

Automatically export generated models to this directory.

#### Value

an object of class H2ODimReductionModel.

#### References

N. Halko, P.G. Martinsson, J.A. Tropp. Finding structure with randomness: Probabilistic algorithms for constructing approximate matrix decompositions[http://arxiv.org/abs/0909.4061]. SIAM Rev., Survey and Review section, Vol. 53, num. 2, pp. 217-288, June 2011.

h2o.table 279

#### **Examples**

```
## Not run:
library(h2o)
h2o.init()
australia_path <- system.file("extdata", "australia.csv", package = "h2o")
australia <- h2o.uploadFile(path = australia_path)
h2o.svd(training_frame = australia, nv = 8)
## End(Not run)</pre>
```

h2o.table

Cross Tabulation and Table Creation in H2O

#### **Description**

Uses the cross-classifying factors to build a table of counts at each combination of factor levels.

## Usage

```
h2o.table(x, y = NULL, dense = TRUE)
table.H2OFrame(x, y = NULL, dense = TRUE)
```

### **Arguments**

x An H2OFrame object with at most two columns.

y An H2OFrame similar to x, or NULL.

dense A logical for dense representation, which lists only non-zero counts, 1 combi-

nation per row. Set to FALSE to expand counts across all combinations.

#### Value

Returns a tabulated H2OFrame object.

```
## Not run:
library(h2o)
h2o.init()
prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.uploadFile(path = prostate_path)
summary(prostate)

# Counts of the ages of all patients
head(h2o.table(prostate[, 3]))
h2o.table(prostate[, 3])

# Two-way table of ages (rows) and race (cols) of all patients</pre>
```

280 h2o.tabulate

```
head(h2o.table(prostate[, c(3, 4)]))
h2o.table(prostate[, c(3, 4)])
## End(Not run)
```

h2o.tabulate

Tabulation between Two Columns of an H2OFrame

#### **Description**

Simple Co-Occurrence based tabulation of X vs Y, where X and Y are two Vecs in a given dataset. Uses histogram of given resolution in X and Y. Handles numerical/categorical data and missing values. Supports observation weights.

## Usage

```
h2o.tabulate(data, x, y, weights_column = NULL, nbins_x = 50, nbins_y = 50)
```

# Arguments

```
data An H2OFrame object.

x predictor column

y response column

weights_column (optional) observation weights column

nbins_x number of bins for predictor column

nbins_y number of bins for response column
```

#### Value

Returns two TwoDimTables of 3 columns each count\_table: X Y counts response\_table: X meanY counts

h2o.tan 281

h2o.tan

Compute the tangent of x

# Description

Compute the tangent of x

## Usage

```
h2o.tan(x)
```

# Arguments

Х

An H2OFrame object.

## See Also

tan for the base R implementation.

## **Examples**

h2o.tanh

Compute the hyperbolic tangent of x

# Description

Compute the hyperbolic tangent of x

# Usage

```
h2o.tanh(x)
```

# Arguments

Х

An H2OFrame object.

282 h2o.targetencoder

#### See Also

tanh for the base R implementation.

## **Examples**

h2o.targetencoder

Transformation of a categorical variable with a mean value of the target variable

# Description

Transformation of a categorical variable with a mean value of the target variable

## Usage

```
h2o.targetencoder(
    x,
    y,
    training_frame,
    model_id = NULL,
    fold_column = NULL,
    blending = FALSE,
    k = 10,
    f = 20,
    data_leakage_handling = c("None", "KFold", "LeaveOneOut"),
    noise_level = 0.01,
    seed = -1
)
```

## **Arguments**

Χ

(Optional) A vector containing the names or indices of the predictor variables to use in building the model. If x is missing, then all columns except y are used.

h2o.targetencoder 283

y The name or column index of the response variable in the data. The response

must be either a numeric or a categorical/factor variable. If the response is numeric, then a regression model will be trained, otherwise it will train a classi-

fication model.

training\_frame Id of the training data frame.

model\_id Destination id for this model; auto-generated if not specified.

fold\_column Column with cross-validation fold index assignment per observation.

blending Logical. Blending enabled/disabled Defaults to FALSE.

k Inflection point. Used for blending (if enabled). Blending is to be enabled sepa-

rately using the 'blending' parameter. Defaults to 10.

f Smoothing. Used for blending (if enabled). Blending is to be enabled separately

using the 'blending' parameter. Defaults to 20.

data\_leakage\_handling

Data leakage handling strategy. Must be one of: "None", "KFold", "LeaveOne-

Out". Defaults to None.

noise\_level Noise level Defaults to 0.01.

seed Seed for random numbers (affects certain parts of the algo that are stochastic

and those might or might not be enabled by default). Defaults to -1 (time-based

random number).

```
## Not run:
library(h2o)

## End(Not run)</pre>
```

h2o.target\_encode\_apply

Apply Target Encoding Map to Frame

## Description

Applies a target encoding map to an H2OFrame object. Computing target encoding for high cardinality categorical columns can improve performance of supervised learning models. A Target Encoding tutorial is available here: https://github.com/h2oai/h2o-tutorials/blob/master/best-practices/categorical-predictors/target\_encoding.md.

#### Usage

```
h2o.target_encode_apply(
  data,
  x,
  y,
  target_encode_map,
  holdout_type,
  fold_column = NULL,
  blended_avg = TRUE,
  noise_level = NULL,
  seed = -1
)
```

## **Arguments**

data An H2OFrame object with which to apply the target encoding map.

A list containing the names or indices of the variables to encode. A target encoding column will be created for each element in the list. Items in the list can be multiple columns. For example, if  $x = \operatorname{list}(c("A"), c("B", "C"))$ , then the resulting frame will have a target encoding column for A and a target encoding column for B & C (in this case, we group by two columns).

y The name or column index of the response variable in the data. The response variable can be either numeric or binary.

target\_encode\_map

A list of H2OF rame objects that is the results of the  $h2o.target_encode_create$  function.

holdout\_type The holdout type used. Must be one of: "LeaveOneOut", "KFold", "None".

fold_column	(Optional) The name or column index of the fold column in the data. Defaults to NULL (no 'fold_column'). Only required if 'holdout_type' = "KFold".
blended_avg	Logical. (Optional) Whether to perform blended average.
noise_level	(Optional) The amount of random noise added to the target encoding. This helps prevent overfitting. Defaults to $0.01 * range of y$ .
seed	(Optional) A random seed used to generate draws from the uniform distribution for random noise. Defaults to -1.

#### Value

Returns an H2OFrame object containing the target encoding per record.

#### See Also

h2o.target\_encode\_create for creating the target encoding map

## **Examples**

```
## Not run:
library(h2o)
h2o.init()
# Get Target Encoding Frame on bank-additional-full data with numeric `y`
data <- h2o.importFile(</pre>
 path = "https://s3.amazonaws.com/h2o-public-test-data/smalldata/demos/bank-additional-full.csv")
splits <- h2o.splitFrame(data, seed = 1234)</pre>
train <- splits[[1]]</pre>
test <- splits[[2]]</pre>
mapping <- h2o.target_encode_create(data = train, x = list(c("job"), c("job", "marital")),</pre>
                                      y = "age")
# Apply mapping to the training dataset
train_encode <- h2o.target_encode_apply(data = train, x = list(c("job"), c("job", "marital")),</pre>
                                         y = "age", mapping, holdout_type = "LeaveOneOut")
# Apply mapping to a test dataset
test_encode <- h2o.target_encode_apply(data = test, x = list(c("job"), c("job", "marital")),</pre>
                                         y = "age", target_encode_map = mapping,
                                         holdout_type = "None")
## End(Not run)
```

```
h2o.target_encode_create
```

Create Target Encoding Map

### **Description**

Creates a target encoding map based on group-by columns ('x') and a numeric or binary target column ('y'). Computing target encoding for high cardinality categorical columns can improve performance of supervised learning models. A Target Encoding tutorial is available here: https://github.com/h2oai/h2o-tutorials/blob/master/best-practices/categorical-predictors/target\_encoding.md.

## Usage

```
h2o.target_encode_create(data, x, y, fold_column = NULL)
```

#### **Arguments**

data	An H2OFrame object with which to create the target encoding map.
X	A list containing the names or indices of the variables to encode. A target encoding map will be created for each element in the list. Items in the list can be multiple columns. For example, if ' $x = list(c("A"), c("B", "C"))$ ', then there will be one mapping frame for A and one mapping frame for B & C (in this case, we group by two columns).
У	The name or column index of the response variable in the data. The response variable can be either numeric or binary.
fold_column	(Optional) The name or column index of the fold column in the data. Defaults to NULL (no 'fold_column').

#### Value

Returns a list of H2OFrame objects containing the target encoding mapping for each column in 'x'.

#### See Also

h2o.target\_encode\_apply for applying the target encoding mapping to a frame.

h2o.target\_encode\_fit

287

## End(Not run)

# Description

Create Target Encoding Map

#### Usage

```
h2o.target_encode_fit(frame, x, y, fold_column = NULL)
```

#### **Arguments**

frame	An H2OFrame object with which to create the target encoding map.
х	List of categorical column names or indices that we want apply target encoding to. Case when item in the list is a list of multiple columns itself is not supported for now.
у	The name or column index of the response variable in the frame.
fold_column	(Optional) The name or column index of the fold column in the frame.

## **Details**

This is an API for a new target encoding implemented in JAVA.

Creates a target encoding map based on group-by columns ('x') and binary target column ('y'). Computing target encoding for high cardinality categorical columns can improve performance of supervised learning models.

#### Value

Returns an object containing the target encoding mapping for each column in ' $\mathbf{x}$ '.

## See Also

h2o.target\_encode\_transform for applying the target encoding mapping to a frame.

```
h2o.target_encode_transform
```

Deprecated API. Please use h2o.targetencoder model instead. Transform Frame by Target Encoding Map

#### **Description**

This is an API for a new target encoding implemented in JAVA. Applies a target encoding map to an H2OFrame object. Computing target encoding for high cardinality categorical columns can improve performance of supervised learning models.

## Usage

```
h2o.target_encode_transform(
   frame,
   x,
   y,
   target_encode_map,
   holdout_type,
   fold_column = NULL,
   blended_avg = TRUE,
   inflection_point = 10,
   smoothing = 20,
   noise = -1,
   seed = -1
)
```

## **Arguments**

An H2OFrame object with which to apply the target encoding map. frame List of categorical column names or indices that we want apply target encoding Χ to. Case when item in the list is a list of multiple columns itself is not supported for now. The name or column index of the response variable in the frame. target\_encode\_map An object that is a result of the calling h2o.target\_encode\_fit function. holdout\_type Supported options: 1) "kfold" - encodings for a fold are generated based on out-of-fold data. 2) "loo" - leave one out. Current row's response value is subtracted from the pre-calculated per-level frequencies. 3) "none" - we do not holdout anything. Using whole frame for training fold\_column (Optional) The name or column index of the fold column in the frame. Logical. (Optional) Whether to perform blended average. Defaults to TRUE blended\_avg

h2o.toFrame 289

inflection\_point

(Optional) Parameter for blending. Used to calculate 'lambda'. Determines half of the minimal sample size for which we completely trust the estimate based on the sample in the particular level of categorical variable. Default value is 10.

smoothing (Optional) Parameter for blending. Used to calculate 'lambda'. Controls the

rate of transition between the particular level's posterior probability and the prior probability. For smoothing values approaching infinity it becomes a hard threshold between the protection and the prior probability. Default only in 20.

old between the posterior and the prior probability. Default value is 20.

noise (Optional) The amount of random noise added to the target encoding. This helps

prevent overfitting. Defaults to 0.01 \* range of y.

seed (Optional) A random seed used to generate draws from the uniform distribution

for random noise. Defaults to -1.

#### Value

Returns an H2OFrame object containing the target encoding per record.

#### See Also

h2o.target\_encode\_fit for creating the target encoding map

h2o.toFrame

Convert a word2vec model into an H2OFrame

#### **Description**

Converts a given word2vec model into an H2OFrame. The frame represents learned word embeddings

#### Usage

```
h2o.toFrame(word2vec)
```

#### **Arguments**

word2vec

A word2vec model.

```
## Not run:
h2o.init()

# Build a dummy word2vec model
data <- as.character(as.h2o(c("a", "b", "a")))
w2v_model <- h2o.word2vec(data, sent_sample_rate = 0, min_word_freq = 0, epochs = 1, vec_size = 2)

# Transform words to vectors and return average vector for each sentence
h2o.toFrame(w2v_model) # -> Frame made of 2 rows and 2 columns

## End(Not run)
```

290 h2o.tolower

h2o.tokenize

Tokenize String

## **Description**

h2o.tokenize is similar to h2o.strsplit, the difference between them is that h2o.tokenize will store the tokenized text into a single column making it easier for additional processing (filtering stop words, word2vec algo, ...).

### Usage

```
h2o.tokenize(x, split)
```

## Arguments

x The column or columns whose strings to tokenize.

split The regular expression to split on.

#### Value

An H2OFrame with a single column representing the tokenized Strings. Original rows of the input DF are separated by NA.

# **Examples**

```
## Not run:
library(h2o)
h2o.init()
string_to_tokenize <- as.h2o("Split at every character and tokenize.")
tokenize_string <- h2o.tokenize(as.character(string_to_tokenize), "")
## End(Not run)</pre>
```

h2o.tolower

Convert strings to lowercase

### **Description**

Convert strings to lowercase

# Usage

```
h2o.tolower(x)
```

### **Arguments**

Χ

An H2OFrame object whose strings should be lower cased

h2o.topN 291

### Value

An H2OFrame with all entries in lowercase format

### **Examples**

```
## Not run:
library(h2o)
h2o.init()
string_to_lower <- as.h2o("ABCDE")
lowered_string <- h2o.tolower(string_to_lower)
## End(Not run)</pre>
```

h2o.topN

H2O topN

## Description

Extract the top N percent of values of a column and return it in a H2OFrame.

#### Usage

```
h2o.topN(x, column, nPercent)
```

### **Arguments**

x an H2OFrame

column is a column name or column index to grab the top N percent value from

nPercent is a top percentage value to grab

#### Value

An H2OFrame with 2 columns. The first column is the original row indices, second column contains the topN values

```
## Not run:
library(h2o)
h2o.init()

f <- "https://s3.amazonaws.com/h2o-public-test-data/bigdata/laptop/jira/TopBottomNRep4.csv.zip"
dataset <- h2o.importFile(f)
frameNames <- names(dataset)
nPercent <- c(1, 2, 3, 4)
nP <- nPercent[sample(1:length(nPercent), 1, replace = FALSE)]
colIndex <- sample(1:length(frameNames), 1, replace = FALSE)
h2o.topN(dataset, frameNames[colIndex], nP)

## End(Not run)</pre>
```

292 h2o.tot\_withinss

h2o.totss

Get the total sum of squares.

### **Description**

If "train", "valid", and "xval" parameters are FALSE (default), then the training totss value is returned. If more than one parameter is set to TRUE, then a named vector of totss' are returned, where the names are "train", "valid" or "xval".

### Usage

```
h2o.totss(object, train = FALSE, valid = FALSE, xval = FALSE)
```

### **Arguments**

object An H2OClusteringModel object.
train Retrieve the training total sum of squares

valid Retrieve the validation total sum of squares

xval Retrieve the cross-validation total sum of squares

### **Examples**

```
## Not run:
library(h2o)
h2o.init()

fr <- h2o.importFile("http://h2o-public-test-data.s3.amazonaws.com/smalldata/iris/iris_train.csv")
predictors <- c("sepal_len", "sepal_wid", "petal_len", "petal_wid")
km <- h2o.kmeans(x = predictors, training_frame = fr, k = 3, nfolds = 3)
h2o.totss(km, train = TRUE)

## End(Not run)</pre>
```

h2o.tot\_withinss

Get the total within cluster sum of squares.

#### **Description**

If "train", "valid", and "xval" parameters are FALSE (default), then the training tot\_withinss value is returned. If more than one parameter is set to TRUE, then a named vector of tot\_withinss' are returned, where the names are "train", "valid" or "xval".

### Usage

```
h2o.tot_withinss(object, train = FALSE, valid = FALSE, xval = FALSE)
```

h2o.toupper 293

#### **Arguments**

object An H2OClusteringModel object.

train Retrieve the training total within cluster sum of squares
valid Retrieve the validation total within cluster sum of squares
xval Retrieve the cross-validation total within cluster sum of squares

## **Examples**

```
## Not run:
library(h2o)
h2o.init()

fr <- h2o.importFile("http://h2o-public-test-data.s3.amazonaws.com/smalldata/iris/iris_train.csv")
predictors <- c("sepal_len", "sepal_wid", "petal_len", "petal_wid")
km <- h2o.kmeans(x = predictors, training_frame = fr, k = 3, nfolds = 3)
h2o.tot_withinss(km, train = TRUE)
## End(Not run)</pre>
```

h2o.toupper

Convert strings to uppercase

#### **Description**

Convert strings to uppercase

## Usage

```
h2o.toupper(x)
```

# **Arguments**

Х

An H2OFrame object whose strings should be upper cased

### Value

An H2OFrame with all entries in uppercase format

```
## Not run:
library(h2o)
h2o.init()
string_to_upper <- as.h2o("abcde")
upper_string <- h2o.toupper(string_to_upper)
## End(Not run)</pre>
```

294 h2o.train\_segments

h2o.train\_segments

H2O Segmented-Data Bulk Model Training

### **Description**

Provides a set of functions to train a group of models on different segments (subpopulations) of the training set.

## Usage

```
h2o.train_segments(
  algorithm,
  segment_columns,
  segment_models_id,
  parallelism = 1,
  ...
)
```

### **Arguments**

algorithm

Name of algorithm to use in training segment models (gbm, randomForest, kmeans, glm, deeplearning, naivebayes, psvm, xgboost, pca, svd, targetencoder, aggregator, word2vec, coxph, isolationforest, kmeans, stackedensemble, glrm, gam).

segment\_columns

A list of columns to segment-by. H2O will group the training (and validation) dataset by the segment-by columns and train a separate model for each segment (group of rows).

segment\_models\_id

Identifier for the returned collection of Segment Models. If not specified it will be automatically generated.

parallelism

Level of parallelism of bulk model building, it is the maximum number of models each H2O node will be building in parallel, defaults to 1.

. . .

Use to pass along training\_frame parameter, x, y, and all non-default parameter values to the algorithm Look at the specific algorithm - h2o.gbm, h2o.glm, h2o.kmeans, h2o.deepLearning - for available parameters.

### **Details**

Start Segmented-Data bulk Model Training for a given algorithm and parameters.

```
## Not run:
library(h2o)
h2o.init()
iris_hf <- as.h2o(iris)</pre>
```

h2o.transform 295

h2o.transform

Use H2O Transformation model and apply the underlying transformation

# Description

Use H2O Transformation model and apply the underlying transformation

### Usage

```
h2o.transform(model, ...)
```

### **Arguments**

model A trained model representing the transformation strategy

... Transformation model-specific parameters

#### Value

Returns an H2OFrame object with data transformed.

```
{\it h2o.transform, H2OT argetEncoderModel-method} \\ Applies\ target\ encoding\ to\ a\ given\ dataset
```

### **Description**

Applies target encoding to a given dataset

### Usage

```
## S4 method for signature 'H2OTargetEncoderModel'
h2o.transform(
  model,
  data,
  data_leakage_handling = NULL,
  use_blending = NULL,
  inflection_point = -1,
  smoothing = -1,
  noise = -1,
  seed = -1
)
```

## **Arguments**

model A trained model representing the transformation strategy

data An H2OFrame with data to be transformed

data\_leakage\_handling

Handling of data leakage. Available options are : ["None", "LeaveOneOut",

"KFold"]. Defaults to "None".

inflection\_point

Blending parameter. Only effective when blending is enabled. By default, model

settings are respected, if not overridden by this setting.

smoothing Blending parameter. Only effective when blending is enabled. By default, model

settings are respected, if not overridden by this setting.

noise An amount of random noise added to the encoding. This helps prevent overfit-

ting. Defaults to 0.01 \* range of response.

seed A random seed used to generate draws from the uniform distribution for random

noise. Defaults to -1.

#### Value

Returns an H2OFrame object with data transformed.

h2o.transform, H2OWordEmbeddingModel-method

Transform words (or sequences of words) to vectors using a word2vec model.

### Description

Transform words (or sequences of words) to vectors using a word2vec model.

#### Usage

```
## S4 method for signature 'H2OWordEmbeddingModel'
h2o.transform(model, words, aggregate_method = c("NONE", "AVERAGE"))
```

#### **Arguments**

model A word2vec model.

words An H2OFrame made of a single column containing source words.

aggregate\_method

Specifies how to aggregate sequences of words. If method is 'NONE' then no aggregation is performed and each input word is mapped to a single word-vector. If method is 'AVERAGE' then input is treated as sequences of words delimited by NA. Each word of a sequences is internally mapped to a vector and vectors belonging to the same sentence are averaged and returned in the result.

### **Examples**

```
## Not run:
h2o.init()

# Build a simple word2vec model
data <- as.character(as.h2o(c("a", "b", "a")))
w2v_model <- h2o.word2vec(data, sent_sample_rate = 0, min_word_freq = 0, epochs = 1, vec_size = 2)

# Transform words to vectors without aggregation
sentences <- as.character(as.h2o(c("b", "c", "a", NA, "b")))
h2o.transform(w2v_model, sentences) # -> 5 rows total, 2 rows NA ("c" is not in the vocabulary)

# Transform words to vectors and return average vector for each sentence
h2o.transform(w2v_model, sentences, aggregate_method = "AVERAGE") # -> 2 rows

## End(Not run)
```

h2o.transform\_word2vec

Transform words (or sequences of words) to vectors using a word2vec model.

### Description

Transform words (or sequences of words) to vectors using a word2vec model.

# Usage

```
h2o.transform_word2vec(
  word2vec,
  words,
  aggregate_method = c("NONE", "AVERAGE")
)
```

298 h2o.trim

## Arguments

word2vec M word2vec model.

words An H2OFrame made of a single column containing source words.

aggregate\_method

Specifies how to aggregate sequences of words. If method is 'NONE' then no aggregation is performed and each input word is mapped to a single word-vector. If method is 'AVERAGE' then input is treated as sequences of words delimited by NA. Each word of a sequences is internally mapped to a vector and vectors belonging to the same sentence are averaged and returned in the result.

# **Examples**

```
## Not run:
h2o.init()

# Build a dummy word2vec model
data <- as.character(as.h2o(c("a", "b", "a")))
w2v_model <- h2o.word2vec(data, sent_sample_rate = 0, min_word_freq = 0, epochs = 1, vec_size = 2)

# Transform words to vectors without aggregation
sentences <- as.character(as.h2o(c("b", "c", "a", NA, "b")))
h2o.transform(w2v_model, sentences) # -> 5 rows total, 2 rows NA ("c" is not in the vocabulary)

# Transform words to vectors and return average vector for each sentence
h2o.transform(w2v_model, sentences, aggregate_method = "AVERAGE") # -> 2 rows

## End(Not run)
```

h2o.trim

Trim Space

#### **Description**

Trim Space

## Usage

h2o.trim(x)

#### **Arguments**

Χ

The column whose strings should be trimmed.

h2o.trunc 299

## **Examples**

```
## Not run:
library(h2o)
h2o.init()
string_to_trim <- as.h2o("r tutorial")
trim_string <- h2o.trim(string_to_trim)
## End(Not run)</pre>
```

h2o.trunc

Truncate values in x toward 0

# Description

trunc takes a single numeric argument x and returns a numeric vector containing the integers formed by truncating the values in x toward 0.

# Usage

```
h2o.trunc(x)
```

# Arguments

Χ

An H2OFrame object.

### See Also

trunc for the base R implementation.

300 h2o.upload\_model

h2o.unique

H2O Unique

### **Description**

Extract unique values in the column.

### Usage

```
h2o.unique(x)
```

### **Arguments**

Х

An H2OFrame object.

#### Value

Returns an H2OFrame object.

# Examples

```
## Not run:
library(h2o)
h2o.init()

f <- "http://h2o-public-test-data.s3.amazonaws.com/smalldata/iris/iris_wheader.csv"
iris <- h2o.importFile(f)
h2o.unique(iris["class"])
## End(Not run)</pre>
```

h2o.upload\_model

Upload a binary model from the provided local path to the H2O cluster. (H2O model can be saved in a binary form either by saveModel() or by download\_model() function.)

### **Description**

Upload a binary model from the provided local path to the H2O cluster. (H2O model can be saved in a binary form either by saveModel() or by download\_model() function.)

## Usage

```
h2o.upload_model(path)
```

h2o.upload\_mojo 301

### **Arguments**

path

A path on the machine this python session is currently connected to, specifying the location of the model to upload.

#### Value

Returns a new H2OModel object.

#### See Also

```
h2o.saveModel, h2o.download_model
```

h2o.upload\_mojo

Imports a MOJO from a local filesystem, creating a Generic model with it.

## Description

Usage example: mojo\_model <- h2o.upload\_mojo(model\_file\_path = "/path/to/local/mojo.zip") predictions <- h2o.predict(mojo\_model, dataset)

### Usage

```
h2o.upload_mojo(mojo_local_file_path)
```

#### **Arguments**

```
mojo_local_file_path
```

Filesystem path to the model imported

#### Value

Returns H2O Generic Model embedding given MOJO model

```
## Not run:

# Import default Iris dataset as H2O frame
data <- as.h2o(iris)

# Train a very simple GBM model
features <- c("Sepal.Length", "Sepal.Length", "Sepal.Width", "Petal.Length", "Petal.Width")
original_model <- h2o.gbm(x=features, y = "Species", training_frame = data)

# Download the trained GBM model as MOJO (temporary directory used in this example)
mojo_original_name <- h2o.download_mojo(model = original_model, path = tempdir())
mojo_original_path <- paste0(tempdir(),"/",mojo_original_name)</pre>
```

302 h2o.var

```
# Upload the MOJO from local filesystem and obtain a Generic model
mojo_model <- h2o.upload_mojo(mojo_original_path)

# Perform scoring with the generic model
predictions <- h2o.predict(mojo_model, data)

## End(Not run)</pre>
```

h2o.var

Variance of a column or covariance of columns.

## Description

Compute the variance or covariance matrix of one or two H2OFrames.

### Usage

```
h2o.var(x, y = NULL, na.rm = FALSE, use)
var(x, y = NULL, na.rm = FALSE, use)
```

### Arguments

x An H2OFrame object.

y NULL (default) or an H2OFrame. The default is equivalent to y = x.

na.rm logical. Should missing values be removed?

use An optional character string indicating how to handle missing values. This must

be one of the following: "everything" - outputs NaNs whenever one of its contributing observations is missing "all.obs" - presence of missing observations will throw an error "complete.obs" - discards missing values along with all ob-

servations in their rows so that only complete observations are used

### See Also

var for the base R implementation. h2o.sd for standard deviation.

```
## Not run:
library(h2o)
h2o.init()

prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.uploadFile(path = prostate_path)
var(prostate$AGE)

## End(Not run)</pre>
```

h2o.varimp 303

h2o.varimp

Retrieve the variable importance.

### **Description**

Retrieve the variable importance.

### Usage

```
h2o.varimp(object)
```

### **Arguments**

object

An H2OModel object.

### **Examples**

```
## Not run:
library(h2o)
h2o.init()

f <- "http://s3.amazonaws.com/h2o-public-test-data/smalldata/prostate/prostate_complete.csv.zip"
pros <- h2o.importFile(f)
response <- "GLEASON"
predictors <- c("ID","AGE","CAPSULE","DCAPS","PSA","VOL","DPROS")
model <- h2o.glm(x = predictors, y = response, training_frame = pros)
h2o.varimp(model)

## End(Not run)</pre>
```

h2o.varimp\_plot

Plot Variable Importances

# Description

Plot Variable Importances

### Usage

```
h2o.varimp_plot(model, num_of_features = NULL)
```

# **Arguments**

 ${\sf model}$ 

A trained model (accepts a trained random forest, GBM, or deep learning model, will use h2o.std\_coef\_plot for a trained GLM

```
num_of_features
```

The number of features shown in the plot (default is 10 or all if less than 10).

304 h2o.varsplits

#### See Also

```
h2o.std_coef_plot for GLM.
```

#### **Examples**

```
## Not run:
library(h2o)
h2o.init()
prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.importFile(prostate_path)
prostate[,2] <- as.factor(prostate[,2])
model <- h2o.gbm(x = 3:9, y = 2, training_frame = prostate, distribution = "bernoulli")
h2o.varimp_plot(model)

# for deep learning set the variable_importance parameter to TRUE
iris_hf <- as.h2o(iris)
iris_dl <- h2o.deeplearning(x = 1:4, y = 5, training_frame = iris_hf,
variable_importances = TRUE)
h2o.varimp_plot(iris_dl)

## End(Not run)</pre>
```

h2o.varsplits

Retrieve per-variable split information for a given Isolation Forest model. Output will include: - count - The number of times a variable was used to make a split. - aggregated\_split\_ratios - The split ratio is defined as "abs(#left\_observations - #right\_observations) / #before\_split". Even splits (#left\_observations approx the same as #right\_observations) contribute less to the total aggregated split ratio value for the given feature; highly imbalanced splits (eg. #left\_observations) \* #right\_observations) contribute more. - aggregated\_split\_depths - The sum of all depths of a variable used to make a split. (If a variable is used on level N of a tree, then it contributes with N to the total aggregate.)

### **Description**

Retrieve per-variable split information for a given Isolation Forest model. Output will include: - count - The number of times a variable was used to make a split. - aggregated\_split\_ratios - The split ratio is defined as "abs(#left\_observations - #right\_observations) / #before\_split". Even splits (#left\_observations approx the same as #right\_observations) contribute less to the total aggregated split ratio value for the given feature; highly imbalanced splits (eg. #left\_observations) \* #right\_observations) contribute more. - aggregated\_split\_depths - The sum of all depths of a variable used to make a split. (If a variable is used on level N of a tree, then it contributes with N to the total aggregate.)

### Usage

```
h2o.varsplits(object)
```

h2o.week 305

### **Arguments**

object

An Isolation Forest model represented by H2OModel object.

h2o.week

Convert Milliseconds to Week of Week Year in H2O Datasets

# Description

Converts the entries of an H2OFrame object from milliseconds to weeks of the week year (starting from 1).

## Usage

```
h2o.week(x)
week(x)
## S3 method for class 'H20Frame'
week(x)
```

#### **Arguments**

Х

An H2OFrame object.

## Value

An H2OFrame object containing the entries of x converted to weeks of the week year.

### See Also

h2o.month

```
## Not run:
library(h2o)
h2o.init()

f <- "https://s3.amazonaws.com/h2o-public-test-data/smalldata/jira/v-11-eurodate.csv"
hdf <- h2o.importFile(f)
h2o.week(hdf["ds9"])
## End(Not run)</pre>
```

306 h2o.which

h2o.weights

Retrieve the respective weight matrix

# Description

Retrieve the respective weight matrix

## Usage

```
h2o.weights(object, matrix_id = 1)
```

### Arguments

object An H2OModel or H2OModelMetrics

matrix\_id An integer, ranging from 1 to number of layers + 1, that specifies the weight

matrix to return.

### **Examples**

h2o.which

Which indices are TRUE?

# Description

Give the TRUE indices of a logical object, allowing for array indices.

## Usage

```
h2o.which(x)
```

h2o.which\_max 307

### **Arguments**

Х

An H2OFrame object.

#### Value

Returns an H2OFrame object.

#### See Also

which for the base R method.

# Examples

```
## Not run:
library(h2o)
h2o.init()

iris_hf <- as.h2o(iris)
h2o.which(iris_hf[, 1] == 4.4)
## End(Not run)</pre>
```

h2o.which\_max

Which indice contains the max value?

### **Description**

Get the index of the max value in a column or row

### Usage

```
h2o.which_max(x, na.rm = TRUE, axis = 0)
which.max.H2OFrame(x, na.rm = TRUE, axis = 0)
which.min.H2OFrame(x, na.rm = TRUE, axis = 0)
```

# Arguments

x An H2OFrame object.

na.rm logical. Indicate whether missing values should be removed.

axis integer. Indicate whether to calculate the mean down a column (0) or across a row (1).

## Value

Returns an H2OFrame object.

308 h2o.which\_min

#### See Also

which.max for the base R method.

# **Examples**

h2o.which\_min

Which index contains the min value?

### **Description**

Get the index of the min value in a column or row

#### Usage

```
h2o.which_min(x, na.rm = TRUE, axis = 0)
```

### **Arguments**

x An H2OFrame object.

 ${\tt na.rm} \qquad \qquad {\tt logical.} \ {\tt Indicate} \ {\tt whether} \ {\tt missing} \ {\tt values} \ {\tt should} \ {\tt be} \ {\tt removed}.$ 

axis integer. Indicate whether to calculate the mean down a column (0) or across a

row (1).

### Value

Returns an H2OFrame object.

#### See Also

which.min for the base R method.

h2o.withinss 309

#### **Examples**

h2o.withinss

Get the Within SS

### **Description**

Get the Within SS

### Usage

```
h2o.withinss(object)
```

### Arguments

object

An H2OClusteringModel object.

h2o.word2vec

Trains a word2vec model on a String column of an H2O data frame

#### **Description**

Trains a word2vec model on a String column of an H2O data frame

# Usage

```
h2o.word2vec(
  training_frame = NULL,
  model_id = NULL,
  min_word_freq = 5,
  word_model = c("SkipGram", "CBOW"),
  norm_model = c("HSM"),
  vec_size = 100,
```

310 h2o.word2vec

```
window_size = 5,
sent_sample_rate = 0.001,
init_learning_rate = 0.025,
epochs = 5,
pre_trained = NULL,
max_runtime_secs = 0,
export_checkpoints_dir = NULL)
```

### **Arguments**

training\_frame Id of the training data frame.

model\_id Destination id for this model; auto-generated if not specified.

min\_word\_freq This will discard words that appear less than <int> times Defaults to 5.

word\_model The word model to use (SkipGram or CBOW) Must be one of: "SkipGram",

"CBOW". Defaults to SkipGram.

norm\_model Use Hierarchical Softmax Must be one of: "HSM". Defaults to HSM.

vec\_size Set size of word vectors Defaults to 100.

window\_size Set max skip length between words Defaults to 5.

sent\_sample\_rate

Set threshold for occurrence of words. Those that appear with higher frequency in the training data will be randomly down-sampled; useful range is (0, 1e-5)

Defaults to 0.001.

init\_learning\_rate

Set the starting learning rate Defaults to 0.025.

epochs Number of training iterations to run Defaults to 5.

pre\_trained Id of a data frame that contains a pre-trained (external) word2vec model

max\_runtime\_secs

Maximum allowed runtime in seconds for model training. Use 0 to disable.

Defaults to 0.

export\_checkpoints\_dir

Automatically export generated models to this directory.

```
vec <- h2o.word2vec(training_frame = words)
h2o.findSynonyms(vec, "teacher", count = 20)
## End(Not run)</pre>
```

h2o.xgboost

Build an eXtreme Gradient Boosting model

## **Description**

Builds a eXtreme Gradient Boosting model using the native XGBoost backend.

### Usage

```
h2o.xgboost(
  Х,
 у,
  training_frame,
  model_id = NULL,
  validation_frame = NULL,

dmatrix_type = c("auto", "dense", "sparse"),
backend = c("auto", "gpu", "cpu"),
gpu_id = 0,
verbose = FALSE
```

#### **Arguments**

У

)

x (Optional) A vector containing the names or indices of the predictor variables to use in building the model. If x is missing, then all columns except y are used.

The name or column index of the response variable in the data. The response must be either a numeric or a categorical/factor variable. If the response is numeric, then a regression model will be trained, otherwise it will train a classi-

fication model.

training\_frame Id of the training data frame.

model\_id Destination id for this model; auto-generated if not specified.

validation\_frame

Id of the validation data frame.

nfolds Number of folds for K-fold cross-validation (0 to disable or  $\geq$  2). Defaults to

keep\_cross\_validation\_models

Logical. Whether to keep the cross-validation models. Defaults to TRUE.

keep\_cross\_validation\_predictions

Logical. Whether to keep the predictions of the cross-validation models. Defaults to FALSE.

keep\_cross\_validation\_fold\_assignment

Logical. Whether to keep the cross-validation fold assignment. Defaults to

score\_each\_iteration

Logical. Whether to score during each iteration of model training. Defaults to

fold\_assignment

Cross-validation fold assignment scheme, if fold\_column is not specified. The 'Stratified' option will stratify the folds based on the response variable, for classification problems. Must be one of: "AUTO", "Random", "Modulo", "Stratified". Defaults to AUTO.

fold\_column Column with cross-validation fold index assignment per observation.

ignore\_const\_cols

Logical. Ignore constant columns. Defaults to TRUE.

offset\_column Offset column. This will be added to the combination of columns before applying the link function.

weights\_column Column with observation weights. Giving some observation a weight of zero is equivalent to excluding it from the dataset; giving an observation a relative weight of 2 is equivalent to repeating that row twice. Negative weights are not allowed. Note: Weights are per-row observation weights and do not increase the size of the data frame. This is typically the number of times a row is repeated, but non-integer values are supported as well. During training, rows with higher weights matter more, due to the larger loss function pre-factor.

stopping\_rounds

Early stopping based on convergence of stopping\_metric. Stop if simple moving average of length k of the stopping\_metric does not improve for k:=stopping\_rounds scoring events (0 to disable) Defaults to 0.

stopping\_metric

Metric to use for early stopping (AUTO: logloss for classification, deviance for regression and anonomaly\_score for Isolation Forest). Note that custom and custom\_increasing can only be used in GBM and DRF with the Python client. Must be one of: "AUTO", "deviance", "logloss", "MSE", "RMSE", "MAE", "RMSLE", "AUC", "AUCPR", "lift\_top\_group", "misclassification", "mean\_per\_class\_error", "custom", "custom\_increasing". Defaults to AUTO.

stopping\_tolerance

Relative tolerance for metric-based stopping criterion (stop if relative improvement is not at least this much) Defaults to 0.001.

max\_runtime\_secs

Maximum allowed runtime in seconds for model training. Use 0 to disable.

Defaults to 0.

seed Seed for random numbers (affects certain parts of the algo that are stochastic

and those might or might not be enabled by default). Defaults to -1 (time-based

random number).

distribution Distribution function Must be one of: "AUTO", "bernoulli", "multinomial",

"gaussian", "poisson", "gamma", "tweedie", "laplace", "quantile", "huber". De-

faults to AUTO.

tweedie\_power Tweedie power for Tweedie regression, must be between 1 and 2. Defaults to

1.5.

categorical\_encoding

Encoding scheme for categorical features Must be one of: "AUTO", "Enum", "OneHotInternal", "OneHotExplicit", "Binary", "Eigen", "LabelEncoder", "Sort-

ByResponse", "EnumLimited". Defaults to AUTO.

quiet\_mode Logical. Enable quiet mode Defaults to TRUE.

checkpoint Model checkpoint to resume training with.

export\_checkpoints\_dir

Automatically export generated models to this directory.

ntrees (same as n\_estimators) Number of trees. Defaults to 50.

max\_depth Maximum tree depth. Defaults to 6.

min\_rows (same as min\_child\_weight) Fewest allowed (weighted) observations in a leaf.

Defaults to 1.

min\_child\_weight

(same as min\_rows) Fewest allowed (weighted) observations in a leaf. Defaults

to 1.

learn\_rate (same as eta) Learning rate (from 0.0 to 1.0) Defaults to 0.3.

eta (same as learn\_rate) Learning rate (from 0.0 to 1.0) Defaults to 0.3.

sample\_rate (same as subsample) Row sample rate per tree (from 0.0 to 1.0) Defaults to 1.

 $subsample \qquad \qquad (same \ as \ sample\_rate) \ Row \ sample \ rate \ per \ tree \ (from \ 0.0 \ to \ 1.0) \ Defaults \ to \ 1.$ 

col\_sample\_rate

(same as colsample\_bylevel) Column sample rate (from  $0.0\ \text{to}\ 1.0$ ) Defaults to

1.

colsample\_bylevel

(same as col\_sample\_rate) Column sample rate (from 0.0 to 1.0) Defaults to 1.

col\_sample\_rate\_per\_tree

(same as colsample\_bytree) Column sample rate per tree (from 0.0 to 1.0) De-

faults to 1.

colsample\_bytree

(same as col\_sample\_rate\_per\_tree) Column sample rate per tree (from 0.0 to 1.0) Defaults to 1.

max\_abs\_leafnode\_pred

(same as max\_delta\_step) Maximum absolute value of a leaf node prediction Defaults to 0.0.

max\_delta\_step (same as max\_abs\_leafnode\_pred) Maximum absolute value of a leaf node prediction Defaults to 0.0.

monotone\_constraints

A mapping representing monotonic constraints. Use +1 to enforce an increasing constraint and -1 to specify a decreasing constraint.

score\_tree\_interval

Score the model after every so many trees. Disabled if set to 0. Defaults to 0.

min\_split\_improvement

(same as gamma) Minimum relative improvement in squared error reduction for a split to happen Defaults to 0.0.

gamma (same as min\_split\_improvement) Minimum relative improvement in squared error reduction for a split to happen Defaults to 0.0.

Number of parallel threads that can be used to run XGBoost. Cannot exceed H2O cluster limits (-nthreads parameter). Defaults to maximum available Defaults to -1.

save\_matrix\_directory

Directory where to save matrices passed to XGBoost library. Useful for debugging.

build\_tree\_one\_node

Logical. Run on one node only; no network overhead but fewer cpus used. Suitable for small datasets. Defaults to FALSE.

calibrate\_model

nthread

Logical. Use Platt Scaling to calculate calibrated class probabilities. Calibration can provide more accurate estimates of class probabilities. Defaults to FALSE.

calibration\_frame

Calibration frame for Platt Scaling

max\_bins For tree\_method=hist only: maximum number of bins Defaults to 256.

max\_leaves For tree\_method=hist only: maximum number of leaves Defaults to 0.

min\_sum\_hessian\_in\_leaf

For tree\_method=hist only: the minimum sum of hessian in a leaf to keep splitting Defaults to 100.0.

min\_data\_in\_leaf

For tree\_method=hist only: the minimum data in a leaf to keep splitting Defaults to 0.0.

sample\_type For booster=dart only: sample\_type Must be one of: "uniform", "weighted". Defaults to uniform.

normalize\_type For booster=dart only: normalize\_type Must be one of: "tree", "forest". Defaults

rate\_drop For booster=dart only: rate\_drop (0..1) Defaults to 0.0.

one\_drop Logical. For booster=dart only: one\_drop Defaults to FALSE.

skip\_drop For booster=dart only: skip\_drop (0..1) Defaults to 0.0.

316 h2o.xgboost.available

Tree method Must be one of: "auto", "exact", "approx", "hist". Defaults to auto. tree\_method Grow policy - depthwise is standard GBM, lossguide is LightGBM Must be one grow\_policy of: "depthwise", "lossguide". Defaults to depthwise. booster Booster type Must be one of: "gbtree", "gblinear", "dart". Defaults to gbtree. reg\_lambda L2 regularization Defaults to 1.0. reg\_alpha L1 regularization Defaults to 0.0. dmatrix\_type Type of DMatrix. For sparse, NAs and 0 are treated equally. Must be one of: "auto", "dense", "sparse". Defaults to auto. backend Backend. By default (auto), a GPU is used if available. Must be one of: "auto", "gpu", "cpu". Defaults to auto. Which GPU to use. Defaults to 0. gpu\_id

Logical. Print scoring history to the console (Metrics per tree). Defaults to

## **Examples**

verbose

FALSE.

```
## Not run:
library(h2o)
h2o.init()
# Import the titanic dataset
f <- "https://s3.amazonaws.com/h2o-public-test-data/smalldata/gbm_test/titanic.csv"
titanic <- h2o.importFile(f)</pre>
# Set predictors and response; set response as a factor
titanic['survived'] <- as.factor(titanic['survived'])</pre>
predictors <- setdiff(colnames(titanic), colnames(titanic)[2:3])</pre>
response <- "survived"
# Split the dataset into train and valid
splits <- h2o.splitFrame(data = titanic, ratios = .8, seed = 1234)</pre>
train <- splits[[1]]</pre>
valid <- splits[[2]]</pre>
# Train the XGB model
titanic_xgb <- h2o.xgboost(x = predictors, y = response,</pre>
                            training_frame = train, validation_frame = valid,
                             booster = "dart", normalize_type = "tree",
                             seed = 1234)
## End(Not run)
```

h2o.year 317

## **Description**

Ask the H2O server whether a XGBoost model can be built. (Depends on availability of native backend.) Returns True if a XGBoost model can be built, or False otherwise.

# Usage

```
h2o.xgboost.available()
```

h2o.year

Convert Milliseconds to Years in H2O Datasets

# Description

Convert the entries of an H2OFrame object from milliseconds to years, indexed starting from 1900.

# Usage

```
h2o.year(x)
year(x)
## S3 method for class 'H20Frame'
year(x)
```

# Arguments

Х

An H2OFrame object.

### **Details**

This method calls the function of the MutableDateTime class in Java.

### Value

An H2OFrame object containing the entries of x converted to years

## See Also

h2o.month

#### **Examples**

```
## Not run:
library(h2o)
h2o.init()

f <- "https://s3.amazonaws.com/h2o-public-test-data/smalldata/jira/v-11-eurodate.csv"
hdf <- h2o.importFile(f)
h2o.year(hdf["ds9"])
## End(Not run)</pre>
```

H2OAutoML-class

The H2OAutoML class

### Description

This class represents an H2OAutoML object

H2OClusteringModel-class

The H2OClusteringModel object.

### Description

This virtual class represents a clustering model built by H2O.

#### **Details**

This object has slots for the key, which is a character string that points to the model key existing in the H2O cluster, the data used to build the model (an object of class H2OFrame).

### **Slots**

model\_id A character string specifying the key for the model fit in the H2O cluster's key-value store.

algorithm A character string specifying the algorithm that was used to fit the model.

parameters A list containing the parameter settings that were used to fit the model that differ from the defaults.

allparameters A list containing all parameters used to fit the model.

model A list containing the characteristics of the model returned by the algorithm.

**size** The number of points in each cluster.

totss Total sum of squared error to grand mean.

withinss A vector of within-cluster sum of squared error.

**tot\_withinss** Total within-cluster sum of squared error.

**betweenss** Between-cluster sum of squared error.

H2OConnection-class 319

H2OConnection-class

The H2OConnection class.

### Description

This class represents a connection to an H2O cluster.

## Usage

```
## S4 method for signature 'H20Connection'
show(object)
```

#### **Arguments**

object

an H20Connection object.

#### **Details**

Because H2O is not a master-slave architecture, there is no restriction on which H2O node is used to establish the connection between R (the client) and H2O (the server).

A new H2O connection is established via the h2o.init() function, which takes as parameters the 'ip' and 'port' of the machine running an instance to connect with. The default behavior is to connect with a local instance of H2O at port 54321, or to boot a new local instance if one is not found at port 54321.

#### **Slots**

ip A character string specifying the IP address of the H2O cluster.

port A numeric value specifying the port number of the H2O cluster.

name A character value specifying the name of the H2O cluster.

proxy A character specifying the proxy path of the H2O cluster.

https Set this to TRUE to use https instead of http.

cacert Path to a CA bundle file with root and intermediate certificates of trusted CAs.

insecure Set this to TRUE to disable SSL certificate checking.

username Username to login with.

password Password to login with.

use\_spnego Set this to TRUE to use SPNEGO authentication.

cookies Cookies to add to request

context\_path Context path which is appended to H2O server location.

mutable An H2OConnectionMutableState object to hold the mutable state for the H2O connection.

320 H2OCoxPHModel-class

H20ConnectionMutableState

The H2OConnectionMutableState class

## **Description**

This class represents the mutable aspects of a connection to an H2O cluster.

#### **Slots**

```
session_id A character string specifying the H2O session identifier.
key_count A integer value specifying count for the number of keys generated for the session_id.
```

H2OCoxPHModel-class

The H2OCoxPHModel object.

### **Description**

Virtual object representing H2O's CoxPH Model.

## Usage

```
## S4 method for signature 'H2OCoxPHModel'
show(object)

## S3 method for class 'H2OCoxPHModel'
coef(object, ...)

## S3 method for class 'H2OCoxPHModel'
extractAIC(fit, scale, k = 2, ...)

## S3 method for class 'H2OCoxPHModel'
logLik(object, ...)

survfit.H2OCoxPHModel(formula, newdata, ...)

## S3 method for class 'H2OCoxPHModel'
vcov(object, ...)
```

# Arguments

```
object an H2OCoxPHModel object.
... additional arguments to pass on.
fit an H2OCoxPHModel object.
```

scale optional numeric specifying the scale parameter of the model.

k numeric specifying the weight of the equivalent degrees of freedom.

formula an H2OCoxPHModel object.

newdata an optional H20Frame or data. frame with the same variable names as those that

appear in the H20CoxPHModel object.

H2OCoxPHModelSummary-class

The H2OCoxPHModelSummary object.

## **Description**

Wrapper object for summary information compatible with survival package.

## Usage

```
## $4 method for signature 'H2OCoxPHModelSummary'
show(object)

## $3 method for class 'H2OCoxPHModelSummary'
coef(object, ...)
```

## Arguments

object An H2OCoxPHModelSummary object.
... additional arguments to pass on.

#### **Slots**

summary A list containing the a summary compatible with CoxPH summary used in the survival package.

H20Frame-class

The H2OFrame class

# Description

This class represents an H2OFrame object

322 H2OFrame-Extract

H20Frame-Extract

Extract or Replace Parts of an H2OFrame Object

## **Description**

Operators to extract or replace parts of H2OFrame objects.

# Usage

```
## S3 method for class 'H2OFrame'
data[row, col, drop = TRUE]
## S3 method for class 'H2OFrame'
x$name
## S3 method for class 'H2OFrame'
x[[i, exact = TRUE]]
## S3 method for class 'H2OFrame'
x$name
## S3 method for class 'H2OFrame'
x[[i, exact = TRUE]]
## S3 replacement method for class 'H2OFrame'
data[row, col, ...] <- value</pre>
## S3 replacement method for class 'H2OFrame'
data$name <- value
## S3 replacement method for class 'H20Frame'
data[[name]] <- value</pre>
```

### **Arguments**

data	object from which to extract element(s) or in which to replace element(s).
row	index specifying row element(s) to extract or replace. Indices are numeric or character vectors or empty (missing) or will be matched to the names.
col	index specifying column element(s) to extract or replace.
drop	Unused
X	An H2OFrame
name	a literal character string or a name (possibly backtick quoted).
i	index
exact	controls possible partial matching of [[ when extracting a character
	Further arguments passed to or from other methods.

H2OGrid-class 323

value To be assigned

H2OGrid-class H2O Grid

#### **Description**

A class to contain the information about grid results

## Usage

```
## S4 method for signature 'H2OGrid'
show(object)
```

### **Arguments**

object

an H20Grid object.

#### **Slots**

grid\_id the final identifier of grid

model\_ids list of model IDs which are included in the grid object

hyper\_names list of parameter names used for grid search

failed\_params list of model parameters which caused a failure during model building, it can contain a null value

failure\_details list of detailed messages which correspond to failed parameters field

failure\_stack\_traces list of stack traces corresponding to model failures reported by failed\_params and failure\_details fields

failed\_raw\_params list of failed raw parameters

summary\_table table of models built with parameters and metric information.

### See Also

H2OModel for the final model types.

H20LeafNode-class

The H2OLeafNode class.

# Description

This class represents a single leaf node in an H20Tree.

#### **Details**

#' @aliases H2OLeafNode

324 H2OModelFuture-class

H2OModel-class

The H2OModel object.

### **Description**

This virtual class represents a model built by H2O.

### Usage

```
## S4 method for signature 'H2OModel'
show(object)
```

### Arguments

object

an H20Model object.

#### **Details**

This object has slots for the key, which is a character string that points to the model key existing in the H2O cluster, the data used to build the model (an object of class H2OFrame).

#### **Slots**

model\_id A character string specifying the key for the model fit in the H2O cluster's key-value store.

algorithm A character string specifying the algorithm that were used to fit the model.

parameters A list containing the parameter settings that were used to fit the model that differ from the defaults.

allparameters A list containg all parameters used to fit the model.

have\_pojo A logical indicating whether export to POJO is supported

have\_mojo A logical indicating whether export to MOJO is supported

model A list containing the characteristics of the model returned by the algorithm.

H2OModelFuture-class H2O Future Model

### **Description**

A class to contain the information for background model jobs.

#### **Slots**

```
job_key a character key representing the identification of the job process. model_id the final identifier for the model
```

H2OModelMetrics-class 325

# See Also

H2OModel for the final model types.

```
H2OModelMetrics-class The H2OModelMetrics Object.
```

# **Description**

A class for constructing performance measures of H2O models.

# Usage

```
## S4 method for signature 'H2OModelMetrics'
show(object)
## S4 method for signature 'H2OBinomialMetrics'
show(object)
## S4 method for signature 'H2OMultinomialMetrics'
show(object)
## S4 method for signature 'H2OOrdinalMetrics'
show(object)
## S4 method for signature 'H2ORegressionMetrics'
show(object)
## S4 method for signature 'H2OClusteringMetrics'
show(object)
## S4 method for signature 'H2OAutoEncoderMetrics'
show(object)
## S4 method for signature 'H2ODimReductionMetrics'
show(object)
```

# Arguments

object An H2OModelMetrics object

H20Node-class

The H2ONode class.

# **Description**

The H2ONode class.

# Usage

```
## S4 method for signature 'H2ONode'
show(object)
```

# **Arguments**

object

an H20Node object.

#### **Slots**

id An integer representing node's unique identifier. Generated by H2O.

levels A character representing categorical levels on split from parent's node belonging into this node. NULL for root node or non-categorical splits.

#' @aliases H2ONode

H2OSegmentModels-class

H2O Segment Models

# Description

A class to contain the information for segment models.

#### Usage

```
## S4 method for signature 'H2OSegmentModels'
show(object)
```

# **Arguments**

object

an H20Model object.

# **Slots**

segment\_models\_id the identifier for the segment models collections

H2OSegmentModelsFuture-class

H2O Future Segment Models

# **Description**

A class to contain the information for background segment models jobs.

#### **Slots**

job\_key a character key representing the identification of the job process. segment\_models\_id the final identifier for the segment models collections

#### See Also

H2OSegmentModels for the final segment models types.

H2OSplitNode-class

*The H2OSplitNode class.* 

# Description

This class represents a single non-terminal node in an H20Tree.

# Slots

threshold A numeric split threshold, typically when the split column is numerical.

left\_child A H20NodeOrNULL representing the left child node, if a node has one.

right\_child A H20NodeOrNULL representing the right child node, if a node has one.

split\_feature A character representing the name of the column this node splits on.

left\_levels A character representing the levels of a categorical feature heading to the left child of this node. NA for non-categorical split.

right\_levels A character representing the levels of a categorical feature heading to the right child of this node. NA for non-categorical split.

na\_direction A character representing the direction of NA values. LEFT means NA values go to the left child node, RIGH means NA values go to the right child node.

328 H2OTree-class

H20Tree-class

The H2OTree class.

# **Description**

This class represents a model of a Tree built by one of H2O's algorithms (GBM, Random Forest).

# Usage

```
## S4 method for signature 'H2OTree'
show(object)
```

#### **Arguments**

object

an H20Tree object.

#### **Slots**

root\_node A H20Node representing the beginning of the tree behind the model. Allows further tree traversal.

left\_children An integer vector with left child nodes of tree's nodes

right\_children An integer vector with right child nodes of tree's nodes

node\_ids An integer representing identification number of a node. Node IDs are generated by H2O.

descriptions A character vector with descriptions for each node to be found in the tree. Contains split threshold if the split is based on numerical column. For cactegorical splits, it contains list of categorical levels for transition from the parent node.

model id A character with the name of the model this tree is related to.

tree\_number An integer representing the order in which the tree has been built in the model.

tree\_class A character representing name of tree's class. Number of tree classes equals to the number of levels in categorical response column. As there is exactly one class per categorical level, name of tree's class equals to the corresponding categorical level of response column. In case of regression and binomial, the name of the categorical level is ignored can be omitted, as there is exactly one tree built in both cases.

thresholds A numeric split thresholds. Split thresholds are not only related to numerical splits, but might be present in case of categorical split as well.

features A character with names of the feature/column used for the split.

levels A character representing categorical levels on split from parent's node belonging into this node. NULL for root node or non-categorical splits.

nas A character representing if NA values go to the left node or right node. May be NA if node is a leaf.

predictions A numeric representing predictions for each node in the graph.

housevotes 329

housevotes

United States Congressional Voting Records 1984

# **Description**

This data set includes votes for each of the U.S. House of Representatives Congressmen on the 16 key votes identified by the CQA. The CQA lists nine different types of votes: voted for, paired for, and announced for (these three simplified to yea), voted against, paired against, and announced against (these three simplified to nay), voted present, voted present to avoid conflict of interest, and did not vote or otherwise make a position known (these three simplified to an unknown disposition).

#### **Format**

A data frame with 435 rows and 17 columns

#### Source

Congressional Quarterly Almanac, 98th Congress, 2nd session 1984, Volume XL: Congressional Quarterly Inc., Washington, D.C., 1985

#### References

iris

Edgar Anderson's Iris Data

### Description

Measurements in centimeters of the sepal length and width and petal length and width, respectively, for three species of iris flowers.

#### **Format**

A data frame with 150 rows and 5 columns

#### Source

Fisher, R. A. (1936) The use of multiple measurements in taxonomic problems. Annals of Eugenics, 7, Part II, 179-188.

The data were collected by Anderson, Edgar (1935). The irises of the Gaspe Peninsula, Bulletin of the American Iris Society, 59, 2-5.

is.factor

is.character

Check if character

# Description

Check if character

# Usage

```
is.character(x)
```

# **Arguments**

Χ

An H2OFrame object

# **Examples**

```
## Not run:
library(h2o)
h2o.init()

f <- "http://s3.amazonaws.com/h2o-public-test-data/smalldata/coxph_test/heart.csv"
heart <- h2o.importFile(f)

heart["transplant"] <- as.character(heart["transplant"])
is.character(heart["transplant"])
## End(Not run)</pre>
```

is.factor

Check if factor

# Description

Check if factor

# Usage

```
is.factor(x)
```

# Arguments

Х

An H2OFrame object

is.h2o 331

is.h2o

Is H2O Frame object

# Description

Test if object is H2O Frame.

# Usage

```
is.h2o(x)
```

# **Arguments**

Х

An R object.

# **Examples**

is.numeric

Check if numeric

# Description

Check if numeric

# Usage

```
is.numeric(x)
```

# Arguments

Х

An H2OFrame object

332 Logical-or

Keyed-class

Virtual Keyed class

# **Description**

Base class for all objects having a persistent representation on backend.

length, H2OTree-method  $Overrides\ the\ behavior\ of\ length()\ function\ on\ H2OTree\ class.\ Returns\ number\ of\ nodes\ in\ an\ H2OTree$ 

# Description

Overrides the behavior of length() function on  $H2OTree\ class$ . Returns number of nodes in an H2OTree

# Usage

```
## S4 method for signature 'H2OTree'
length(x)
```

# Arguments

Х

An H20Tree to count nodes for.

Logical-or

Logical or for H2OFrames

# **Description**

Logical or for H2OFrames

# Usage

#### **Arguments**

x An H2OFrame object

y An H2OFrame object

ModelAccessors 333

ModelAccessors

Accessor Methods for H2OModel Object

#### **Description**

Function accessor methods for various H2O output fields.

# Usage

```
getParms(object)
## S4 method for signature 'H2OModel'
getParms(object)
getCenters(object)
getCentersStd(object)
getWithinSS(object)
getTotWithinSS(object)
getBetweenSS(object)
getTotSS(object)
getIterations(object)
getClusterSizes(object)
## S4 method for signature 'H2OClusteringModel'
getCenters(object)
## S4 method for signature 'H2OClusteringModel'
getCentersStd(object)

getWithinSS(object)
## S4 method for signature 'H2OClusteringModel'
getTotWithinSS(object)
## S4 method for signature 'H2OClusteringModel'
getBetweenSS(object)
## S4 method for signature 'H2OClusteringModel'
getTotSS(object)
```

334 names.H2OFrame

```
## S4 method for signature 'H2OClusteringModel'
getIterations(object)

## S4 method for signature 'H2OClusteringModel'
getClusterSizes(object)
```

# Arguments

object an H2OModel class object.

names.H2OFrame

Column names of an H2OFrame

# Description

Column names of an H2OFrame

# Usage

```
## S3 method for class 'H2OFrame'
names(x)
```

# **Arguments**

Χ

An H2OFrame

# **Examples**

Ops.H2OFrame 335

Ops.H2OFrame

S3 Group Generic Functions for H2O

# Description

Methods for group generic functions and H2O objects.

# Usage

```
## S3 method for class 'H2OFrame'
Ops(e1, e2)
## S3 method for class 'H2OFrame'
Math(x, ...)
## S3 method for class 'H2OFrame'
Math(x, ...)
## S3 method for class 'H2OFrame'
Math(x, ...)
## S3 method for class 'H2OFrame'
Summary(x, ..., na.rm)
## S3 method for class 'H2OFrame'
! x
## S3 method for class 'H2OFrame'
is.na(x)
## S3 method for class 'H2OFrame'
t(x)
log(x, ...)
log10(x)
log2(x)
log1p(x)
trunc(x, ...)
x %*% y
nrow.H20Frame(x)
```

plot.H2OModel

```
ncol.H20Frame(x)
## S3 method for class 'H20Frame'
length(x)
h2o.length(x)
## S3 replacement method for class 'H20Frame'
names(x) <- value
colnames(x) <- value</pre>
```

#### **Arguments**

e1	object
e2	object
X	object
	Further arguments passed to or from other methods.
na.rm	logical. whether or not missing values should be removed
У	object
value	To be assigned

plot.H2OModel Plot an H2O Model

#### **Description**

Plots training set (and validation set if available) scoring history for an H2O Model

# Usage

```
## S3 method for class 'H2OModel'
plot(x, timestep = "AUTO", metric = "AUTO", ...)
```

### **Arguments**

x A fitted H2OModel object for which the scoring history plot is desired. timestep A unit of measurement for the x-axis.

metric A unit of measurement for the y-axis.
... additional arguments to pass on.

#### **Details**

This method dispatches on the type of H2O model to select the correct scoring history. The timestep and metric arguments are restricted to what is available in the scoring history for a particular type of model.

plot.H2OTabulate 337

#### Value

Returns a scoring history plot.

#### See Also

h2o.deeplearning, h2o.gbm, h2o.glm, h2o.randomForest for model generation in h2o.

# **Examples**

```
## Not run:
if (requireNamespace("mlbench", quietly=TRUE)) {
    library(h2o)
    h2o.init()
    df <- as.h2o(mlbench::mlbench.friedman1(10000,1))</pre>
    rng <- h2o.runif(df, seed=1234)</pre>
    train <- df[rng<0.8,]</pre>
    valid <- df[rng>=0.8,]
    gbm <- h2o.gbm(x = 1:10, y = "y", training_frame = train, validation_frame = valid,</pre>
                   ntrees=500, learn_rate=0.01, score_each_iteration = TRUE)
    plot(gbm)
   plot(gbm, timestep = "duration", metric = "deviance")
   plot(gbm, timestep = "number_of_trees", metric = "deviance")
   plot(gbm, timestep = "number_of_trees", metric = "rmse")
   plot(gbm, timestep = "number_of_trees", metric = "mae")
}
## End(Not run)
```

plot.H2OTabulate

Plot an H2O Tabulate Heatmap

#### **Description**

Plots the simple co-occurrence based tabulation of X vs Y as a heatmap, where X and Y are two Vecs in a given dataset. This function requires suggested ggplot2 package.

# Usage

```
## S3 method for class 'H2OTabulate'
plot(x, xlab = x$cols[1], ylab = x$cols[2], base_size = 12, ...)
```

# Arguments

x An H2OTabulate object for which the heatmap plot is desired.

A title for the x-axis. Defaults to what is specified in the given H2OTabulate object.

338 predict.H2OAutoML

ylab A title for the y-axis. Defaults to what is specified in the given H2OTabulate

object.

base\_size Base font size for plot.

. . . additional arguments to pass on.

#### Value

Returns a ggplot2-based heatmap of co-occurance.

#### See Also

```
h2o.tabulate
```

# **Examples**

predict.H2OAutoML

Predict on an AutoML object

#### **Description**

Obtains predictions from an AutoML object.

# Usage

```
## S3 method for class 'H2OAutoML'
predict(object, newdata, ...)
## S3 method for class 'H2OAutoML'
h2o.predict(object, newdata, ...)
```

# Arguments

object a fitted H2OAutoML object for which prediction is desired

newdata An H2OFrame object in which to look for variables with which to predict.

. . . additional arguments to pass on.

predict.H2OModel 339

#### **Details**

This method generated predictions on the leader model from an AutoML run. The order of the rows in the results is the same as the order in which the data was loaded, even if some rows fail (for example, due to missing values or unseen factor levels).

#### Value

Returns an H2OFrame object with probabilites and default predictions.

predict.H2OModel

Predict on an H2O Model

# Description

Obtains predictions from various fitted H2O model objects.

# Usage

```
## S3 method for class 'H2OModel'
predict(object, newdata, ...)
## S3 method for class 'H2OModel'
h2o.predict(object, newdata, ...)
```

# **Arguments**

object a fitted H2OModel object for which prediction is desired

newdata An H2OFrame object in which to look for variables with which to predict.

... additional arguments to pass on.

#### **Details**

This method dispatches on the type of H2O model to select the correct prediction/scoring algorithm. The order of the rows in the results is the same as the order in which the data was loaded, even if some rows fail (for example, due to missing values or unseen factor levels).

#### Value

Returns an H2OFrame object with probabilites and default predictions.

#### See Also

h2o.deeplearning, h2o.gbm, h2o.glm, h2o.randomForest for model generation in h2o.

### **Examples**

```
## Not run:
library(h2o)
h2o.init()
f <- "https://s3.amazonaws.com/h2o-public-test-data/smalldata/glm_test/insurance.csv"</pre>
insurance <- h2o.importFile(f)</pre>
predictors <- colnames(insurance)[1:4]</pre>
response <- "Claims"
insurance['Group'] <- as.factor(insurance['Group'])</pre>
insurance['Age'] <- as.factor(insurance['Age'])</pre>
splits <- h2o.splitFrame(data = insurance, ratios = 0.8, seed = 1234)</pre>
train <- splits[[1]]</pre>
valid <- splits[[2]]</pre>
insurance_gbm <- h2o.gbm(x = predictors, y = response,
                           training_frame = train,
                           validation_frame = valid,
                           distribution = "huber",
                           huber_alpha = 0.9, seed = 1234)
h2o.predict(insurance_gbm, newdata = insurance)
## End(Not run)
```

predict\_contributions.H2OModel

Predict feature contributions - SHAP values on an H2O Model (only GBM and XGBoost models).

### Description

Returned H2OFrame has shape (#rows, #features + 1) - there is a feature contribution column for each input feature, the last column is the model bias (same value for each row). The sum of the feature contributions and the bias term is equal to the raw prediction of the model. Raw prediction of tree-based model is the sum of the predictions of the individual trees before the inverse link function is applied to get the actual prediction. For Gaussian distribution the sum of the contributions is equal to the model prediction.

#### Usage

```
predict_contributions.H2OModel(object, newdata, ...)
h2o.predict_contributions(object, newdata, ...)
```

#### Arguments

object a fitted H2OModel object for which prediction is desired

newdata An H2OFrame object in which to look for variables with which to predict.

. . . additional arguments to pass on.

#### **Details**

Note: Multinomial classification models are currently not supported.

# Value

Returns an H2OFrame contain feature contributions for each input row.

#### See Also

h2o.gbm and h2o.randomForest for model generation in h2o.

#### **Examples**

```
## Not run:
library(h2o)
h2o.init()
prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.uploadFile(path = prostate_path)
prostate_gbm <- h2o.gbm(3:9, "AGE", prostate)
h2o.predict(prostate_gbm, prostate)
h2o.predict_contributions(prostate_gbm, prostate)
## End(Not run)</pre>
```

```
predict_leaf_node_assignment.H2OModel
```

Predict the Leaf Node Assignment on an H2O Model

# **Description**

Obtains leaf node assignment from fitted H2O model objects.

#### Usage

```
predict_leaf_node_assignment.H2OModel(
  object,
  newdata,
  type = c("Path", "Node_ID"),
  ...
)

h2o.predict_leaf_node_assignment(
  object,
  newdata,
  type = c("Path", "Node_ID"),
  ...
)
```

342 print.H2OFrame

# Arguments

object a fitted H2OModel object for which prediction is desired

newdata An H2OFrame object in which to look for variables with which to predict.

type choice of either "Path" when tree paths are to be returned (default); or "Node\_ID"

when the output

... additional arguments to pass on.

#### **Details**

For every row in the test set, return the leaf placements of the row in all the trees in the model. Placements can be represented either by paths to the leaf nodes from the tree root or by H2O's internal identifiers. The order of the rows in the results is the same as the order in which the data was loaded

#### Value

Returns an H2OFrame object with categorical leaf assignment identifiers for each tree in the model.

#### See Also

h2o.gbm and h2o.randomForest for model generation in h2o.

### **Examples**

```
## Not run:
library(h2o)
h2o.init()
prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.uploadFile(path = prostate_path)
prostate$CAPSULE <- as.factor(prostate$CAPSULE)
prostate_gbm <- h2o.gbm(3:9, "CAPSULE", prostate)
h2o.predict(prostate_gbm, prostate)
h2o.predict_leaf_node_assignment(prostate_gbm, prostate)
## End(Not run)</pre>
```

print.H2OFrame

Print An H2OFrame

#### **Description**

Print An H2OFrame

#### Usage

```
## S3 method for class 'H2OFrame'
print(x, n = 6L, m = 200L, ...)
```

print.H2OTable 343

# **Arguments**

Χ	An H2OFrame object
n	An (Optional) A single integer. If positive, number of rows in x to return. If negative, all but the n first/last number of rows in x. Anything bigger than 20 rows will require asking the server (first 20 rows are cached on the client).
m	An (Optional) A single integer. If positive, number of columns in $x$ to return. If negative, all but the m first/last number of columns in $x$ .
	Further arguments to be passed from or to other methods.

# **Examples**

```
## Not run:
library(h2o)
h2o.init()

f <- "https://s3.amazonaws.com/h2o-public-test-data/smalldata/junit/cars_20mpg.csv"
cars <- h2o.importFile(f)
print(cars, n = 8)

## End(Not run)</pre>
```

print.H2OTable

Print method for H2OTable objects

# **Description**

This will print a truncated view of the table if there are more than 20 rows.

# Usage

```
## S3 method for class 'H2OTable'
print(x, header = TRUE, ...)
```

# **Arguments**

x An H2OTable object
 header A logical value dictating whether or not the table name should be printed.
 ... Further arguments passed to or from other methods.

#### Value

The original x object

range.H2OFrame

#### **Examples**

```
## Not run:
library(h2o)
h2o.init()

f <- "https://s3.amazonaws.com/h2o-public-test-data/smalldata/junit/cars_20mpg.csv"
cars <- h2o.importFile(f)
print(cars, header = TRUE)

## End(Not run)</pre>
```

prostate

Prostate Cancer Study

# **Description**

Baseline exam results on prostate cancer patients from Dr. Donn Young at The Ohio State University Comprehensive Cancer Center.

# **Format**

A data frame with 380 rows and 9 columns

# **Source**

Hosmer and Lemeshow (2000) Applied Logistic Regression: Second Edition.

range.H2OFrame

Range of an H2O Column

# Description

Range of an H2O Column

# Usage

```
## S3 method for class 'H2OFrame'
range(..., na.rm = TRUE)
```

#### **Arguments**

```
... An H2OFrame object.
na.rm ignore missing values
```

scale 345

#### **Examples**

scale

Scaling and Centering of an H2OFrame

# Description

Centers and/or scales the columns of an H2O dataset.

### Usage

```
## S3 method for class 'H2OFrame'
scale(x, center = TRUE, scale = TRUE)
```

#### **Arguments**

x An H2OFrame object.

center either a logical value or numeric vector of length equal to the number of

columns of x.

scale either a logical value or numeric vector of length equal to the number of

columns of x.

# **Examples**

```
## Not run:
library(h2o)
h2o.init()
iris_hf <- as.h2o(iris)
summary(iris_hf)

# Scale and center all the numeric columns in iris data set
iris_scaled <- scale(iris_hf[, 1:4])

## End(Not run)</pre>
```

```
staged_predict_proba.H2OModel
```

Predict class probabilities at each stage of an H2O Model

# Description

The output structure is analogous to the output of h2o.predict\_leaf\_node\_assignment. For each tree t and class c there will be a column Tt.Cc (eg. T3.C1 for tree 3 and class 1). The value will be the corresponding predicted probability of this class by combining the raw contributions of trees T1.Cc,..,TtCc. Binomial models build the trees just for the first class and values in columns Tx.C1 thus correspond to the the probability p0.

#### Usage

```
staged_predict_proba.H2OModel(object, newdata, ...)
h2o.staged_predict_proba(object, newdata, ...)
```

#### **Arguments**

object a fitted H2OModel object for which prediction is desired

newdata An H2OFrame object in which to look for variables with which to predict.

... additional arguments to pass on.

#### Value

Returns an H2OFrame object with predicted probability for each tree in the model.

#### See Also

h2o.gbm and h2o.randomForest for model generation in h2o.

#### **Examples**

```
## Not run:
library(h2o)
h2o.init()
prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.uploadFile(path = prostate_path)
prostate$CAPSULE <- as.factor(prostate$CAPSULE)
prostate_gbm <- h2o.gbm(3:9, "CAPSULE", prostate)
h2o.predict(prostate_gbm, prostate)
h2o.staged_predict_proba(prostate_gbm, prostate)
## End(Not run)</pre>
```

str.H2OFrame 347

str.H2OFrame	Display the structure of an H2OFrame obj	iect
our ingor rame	Display the structure of an 11201 rante obj	cci

# Description

Display the structure of an H2OFrame object

### Usage

```
## S3 method for class 'H2OFrame'
str(object, ..., cols = FALSE)
```

# Arguments

object An H2OFrame.

... Further arguments to be passed from or to other methods.

cols Print the per-column str for the H2OFrame

```
summary\,, \verb+H2OCoxPHModel-method+\\ Summary\,\,method\,for\,\, \verb+H2OCoxPHModel\,\,objects+\\
```

# Description

Summary method for H2OCoxPHModel objects

# Usage

```
## S4 method for signature 'H2OCoxPHModel'
summary(object, conf.int = 0.95, scale = 1)
```

# Arguments

object an H2OCoxPHModel object.

conf.int a specification of the confidence interval.

scale a scale.

```
summary, H2OGrid-method
```

Format grid object in user-friendly way

# Description

Format grid object in user-friendly way

# Usage

```
## S4 method for signature 'H2OGrid'
summary(object, show_stack_traces = FALSE)
```

# **Arguments**

```
object an H20Grid object.
show_stack_traces
a flag to show stack traces for model failures
```

```
summary,H2OModel-method
```

Print the Model Summary

# Description

Print the Model Summary

# Usage

```
## S4 method for signature 'H2OModel'
summary(object, ...)
```

# **Arguments**

```
object An H2OModel object.
```

further arguments to be passed on (currently unimplemented)

use.package 349

use.package

Use optional package

#### **Description**

Testing availability of optional package, its version, and extra global default. This function is used internally. It is exported and documented because user can control behavior of the function by global option.

### Usage

```
use.package(
  package,
  version = "1.9.8"[package == "data.table"],
  use = getOption("h2o.use.data.table", TRUE)[package == "data.table"])
```

#### **Arguments**

package character scalar name of a package that we Suggests or Enhances on.
version character scalar required version of a package.

use

# Details

We use this function to control csv read/write with optional data.table package. Currently data.table is enabled by default for some operations, to disable it set options ("h2o.use.data.table"=FALSE). It is possible to control just fread or fwrite with options ("h2o.fread"=FALSE, "h2o.fwrite"=FALSE). h2o.fread and h2o.fwrite options are not handled in this function but next to *fread* and *fwrite* calls.

logical scalar, extra escape option, to be used as global option.

#### See Also

```
as.h2o.data.frame, as.data.frame.H2OFrame
```

# **Examples**

```
op <- options("h2o.use.data.table" = TRUE)
if (use.package("data.table")) {
  cat("optional package data.table 1.9.8+ is available\n")
} else {
  cat("optional package data.table 1.9.8+ is not available\n")
}
options(op)</pre>
```

350 zzz

walking

Muscular Actuations for Walking Subject

#### **Description**

The musculoskeletal model, experimental data, settings files, and results for three-dimensional, muscle-actuated simulations at walking speed as described in Hamner and Delp (2013). Simulations were generated using OpenSim 2.4. The data is available from https://simtk.org/project/xml/downloads.xml?group\_id=603.

#### **Format**

A data frame with 151 rows and 124 columns

#### References

Logical and for H2OFrames

# Description

Logical and for H2OFrames

# Usage

# Arguments

x An H2OFrame object

y An H2OFrame object

# **Index**
